Intro to Databases

Database Management System (DBMS) provides....

... efficient, reliable, convenient, and safe multi-user storage of and access to massive amounts of persistent data.

Massive

- Persistent
- Safe
- Multi-user
- Convenient
- Efficient
- Reliable

- Database applications may be programmed via "frameworks"
- DBMS may run in conjunction with "middleware"
- Data-intensive applications may not use DBMS at all

Key concepts

- Data model
- Schema versus data
- Data definition language (DDL)
- Data manipulation or query language (DML)

Key people

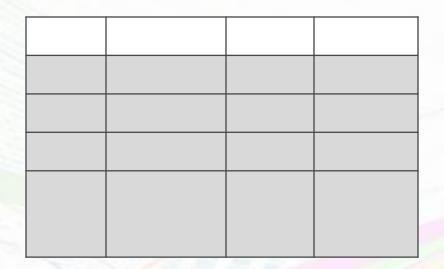

- DBMS implementer
- Database designer
- Database application developer
- Database administrator

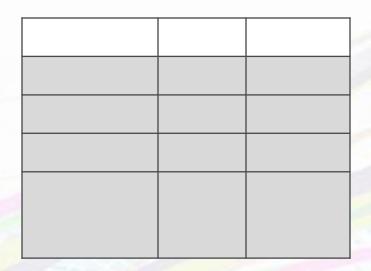

- Used by all major commercial database systems
- Very simple model
- Query with high-level languages: simple yet expressive
- Efficient implementations

Schema = structural description of relations in database **Instance** = actual contents at given point in time

Database = set of named relations (or tables)
Each relation has a set of named attributes (or columns)
Each tuple (or row) has a value for each attribute
Each attribute has a type (or domain)

Student

ID	name	GPA	photo
123	Emil	3.4	••
142	Artur	3	:+)
521	Damir	NULL	

name	unit	CAP
dorm1	205	4
dorm2	205	5
dorm1	403	4

Schema – structural description of relations in database Instance – actual contents at given point in time

Student

ID	name	GPA	photo
123	Emil	3.4	•••
142	Artur	3	:+)
521	Damir	NULL	

name	unit	CAP
dorm1	205	4
dorm2	205	5
dorm1	403	4

NULL – special value for "unknown" or "undefined"

Student

ID	name	GPA	photo
123	Emil	3.4	•••
142	Artur	3	:+)
521	Damir	NULL	·:

name	unit	CAP
dorm1	205	4
dorm2	205	5
dorm1	403	4

Key – attribute whose value is unique in each tuple Or set of attributes whose combined values are unique

Student

ID	name	GPA	photo
123	Emil	3.4	•••
142	Artur	3	:+)
521	Damir	NULL	

name	unit	CAP
dorm1	205	4
dorm2	205	5
dorm1	403	4

Creating relations (tables) in SQL

```
Create Table Student(ID, name, GPA, photo)
```

```
Create Table Dorm
  (name string, unit char(3), CAP integer)
```

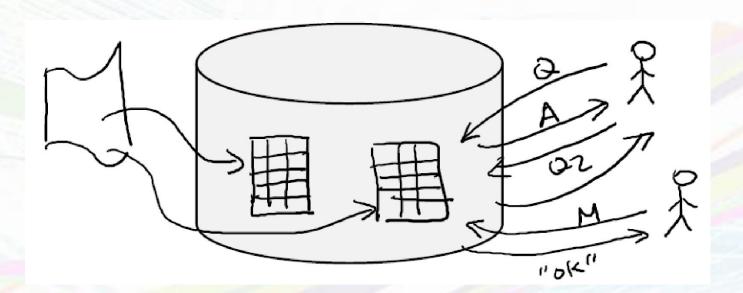

- Used by all major commercial database systems
- Very simple model
- Query with high-level languages: simple yet expressive
- Efficient implementations

Steps in creating and using a (relational) database

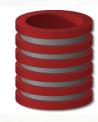

- 1. Design schema; create using DDL
- 2. "Bulk load" initial data
- 3. Repeat: execute queries and modifications

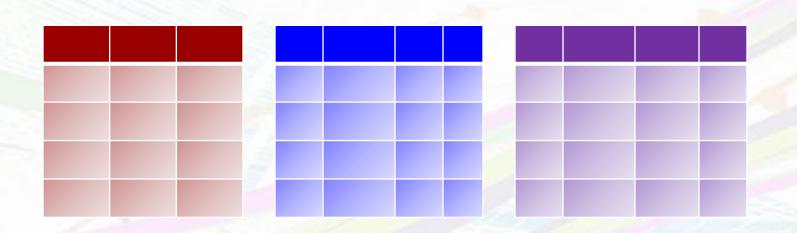

Ad-hoc queries in high-level language

- All students with GPA > 3.7 applying to Stanford and MIT only
- All engineering departments in CA with < 500 applicants
- College with highest average accept rate over last 5 years
- Some easy to pose; some a bit harder
- Some easy for DBMS to execute efficiently; some harder
- "Query language" also used to modify data

Queries return relations ("compositional", "closed")

Query Languages

Relational Algebra

SQL

```
Select Student.ID
From Student, Apply
Where Student.ID=Apply.ID
And GPA>3.7 and college='Stanford'
```

IDs of students with GPA > 3.7 applying to Stanford

Assignment 1

- Write one page essay in latex [sharelatex.com] that includes the followings:
- Your name and email.
- Your short bio.
- Categorize databases based on your opinion by using any search engine.
- Cite all the sources you use.
- No copy-paste.

Whether you know it or not, you're using a database every day
