

Waste Disposal

- The over consumption of resources and creation of plastics are creating a global crisis of waste disposal . Developed countries are notorious for producing an excessive amount of waste or garbage and dumping their waste in the ocean and less developed countries .

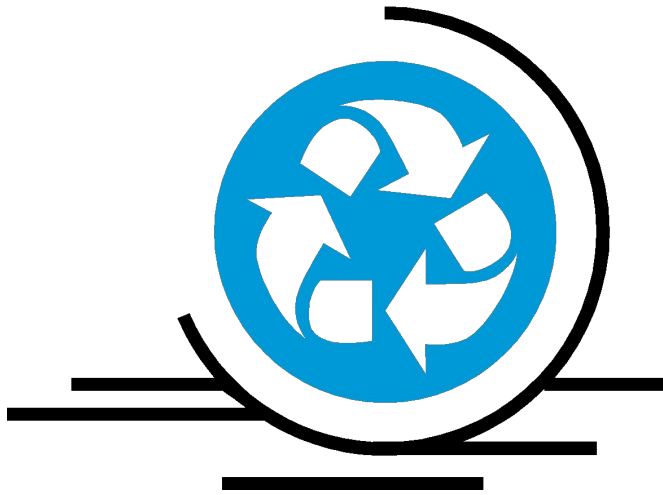

- All cities with their high concentration of population different form a large number of industrial and domestic waste. Wastes are divided into solid and liquid industrial and domestic.

- The problem of waste is a high sharpness due to the low speed of their decomposition . Paper destroyed in 2-10 years old , cans for almost 100 years , plastic- for 500 years and glass 1000 years.

The release of waste is conducted in three areas :

- 1) Storage
- 2) Disposal of waste by burning them
- 3) Treatment
 - Mechanical treatment
 - The chemical treatment
 - Biological treatment

- Example of an effective solution of the problem of fighting waste can be France . In almost all cities across the country have special incineration facilities and waste is presorted. There are plenty of compost companies that recycle waste.
