

System of education

Age for enrollment

- Ideal education: children enter school when they are 7 years old. A year before that, children can go to additional school classes.

Elementary school

- Primary school lasts from 6 to 12 years of age. At this time, students do not have to sit all the time for lessons. It is also correct to cancel the primary school exams.

Collectivism

- All children, regardless of their level of knowledge, study together. This is the reason that the difference between the weakest and the strongest student will be minimal.

Number of students

- The maximum number of students in a class is 15. This allows teachers to pay attention to each student, and children to spend more time doing practical tasks.

One of the main

It is mandatory to teach children skills to solve various problems, traditions and culture of the country, as well as strengthen the basic principles of life.

Secondary school

- Secondary school should have high requirements: teenagers spend a lot of time in school. The number of students increases from about 26 to 35. There are no exams for moving to the next class. Entrance exams will have to be taken before entering the senior secondary school at 15.

Evaluation factors

▣ **Influences assessment:**

- 1) academic performance in subjects,
- 2) extracurricular activity,
- 3) attendance,
- 4) special achievements
- 5) moral development.

High school

- A small number of literate people go to high school. The main part receives secondary vocational education.

School uniform

- The form must be strictly mandatory for primary classes, and the rest of the classes have a free style.

In conclusion

- I think it is right that education should have a special approach to each student. This can be achieved by improving the skills of teachers and their salaries.
