# Loss Forecasting

- Probability distributions commonly used in loss forecasting include:
  - Normal
  - Binomial
  - Exponential
  - Poisson
- The normal distribution is used in many situations

# Exhibit A4.1

## Areas Under the Normal Curve (One Tail)

# Time Value of Money

- When decisions involve consideration of cash flows over time, the interest-earning capacity of money must be taken into account

# Other Risk Management Applications

- An accurate forecast of the timing and magnitude of claims is especially important when losses are retained
- The ability to forecast ultimate claims for liability lines is an important skill for the risk manager
  - Loss development factors are multipliers that can be applied to claims settled to date to estimate the ultimate claims for a period
- When pricing catastrophe bonds, the probability of various loss contingencies must be considered
