23.08.2017

# Risk

Risk can be defined as the combination of the probability of an event and its consequences  
In all types of undertaking, there is the potential for events and consequences that constitute opportunities for benefit (upside) or threats to success (downside).

# Risk Management

Risk Management is increasingly recognised as being concerned with both positive and negative aspects of risk. In the safety field, it is generally recognised that consequences are only negative and therefore the management of safety risk is focused on prevention and mitigation of harm.

# Risk Management

Risk management is a central part of any organisation's strategic management. It is the process whereby organisations methodically address the risks attaching to their activities with the goal of achieving sustained benefit within each activity and across the portfolio of all activities.

# Risk Management

The focus of good risk management is the identification and treatment of these risks. Its objective is to add maximum sustainable value to all the activities of the organisation. It marshals the understanding of the potential upside and downside of all those factors which can affect the organisation.

# Risk Management

It increases the probability of success, and reduces both the probability of failure and the uncertainty of achieving the organisation's overall objectives.

Risk management should be a continuous and developing process which runs throughout the organisation's strategy and the implementation of that strategy. It should address methodically all the risks surrounding the organisation's activities past, present and in particular, future.

# Risk Management

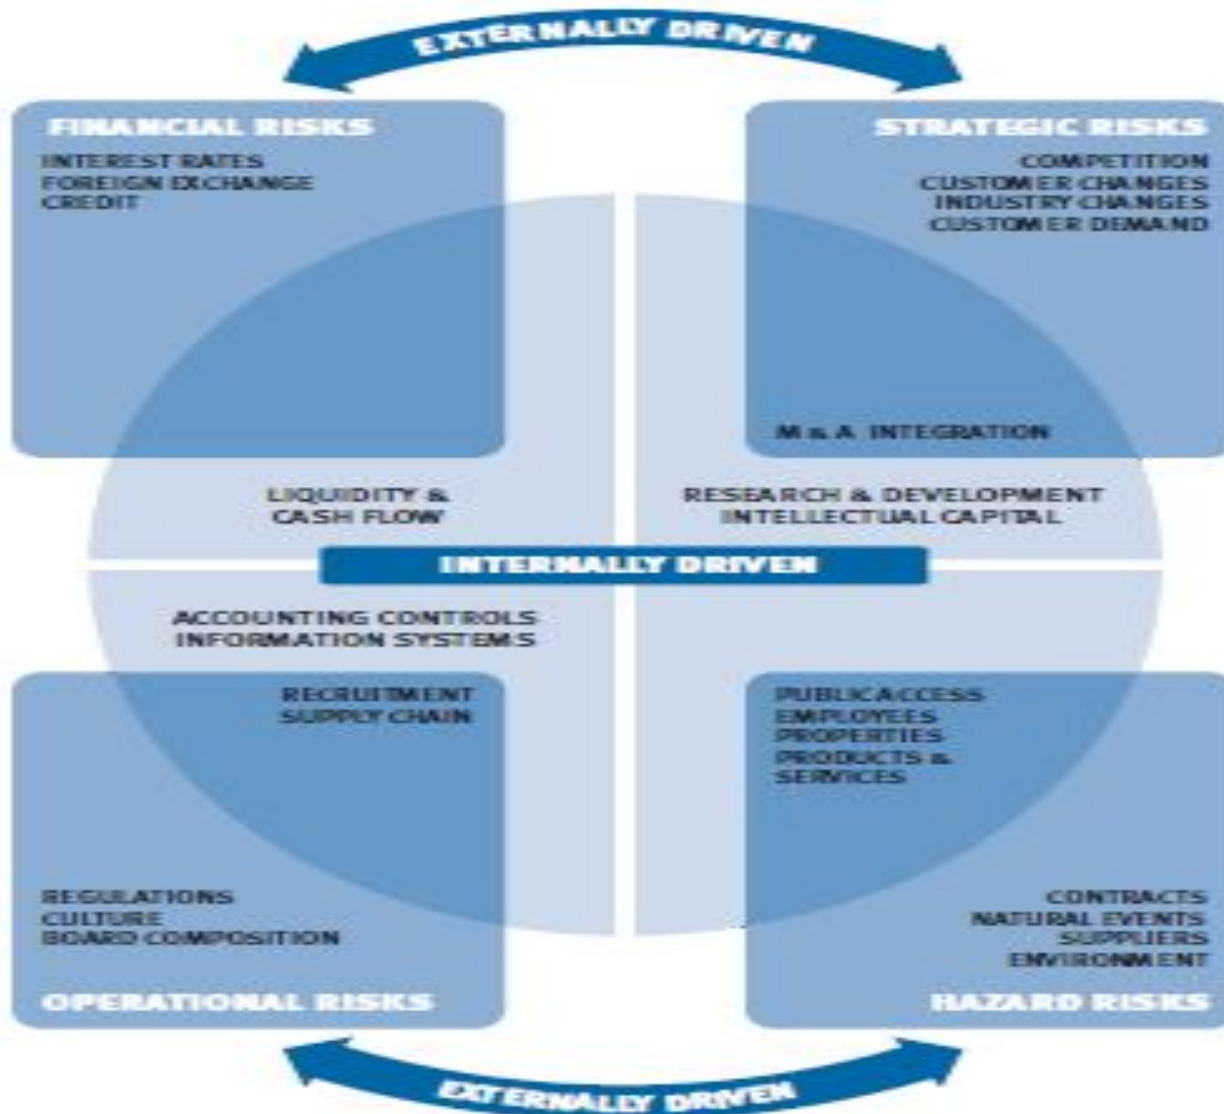

It must be integrated into the culture of the organisation with an effective policy and a programme led by the most senior management. It must translate the strategy into tactical and operational objectives, assigning responsibility throughout the organisation with each manager and employee responsible for the management of risk as part of their job description. It supports accountability, performance measurement and reward, thus promoting operational efficiency at all levels.

# External and Internal Factors

The risks facing an organisation and its operations can result from factors both external and internal to the organisation. The diagram overleaf summarises examples of key risks in these areas and shows that some specific risks can have both external and internal drivers and therefore overlap the two areas. They can be categorised further into types of risk such as strategic, financial, operational, hazard, etc.

# External and Internal Factors

# The Risk Management Process

Risk management protects and adds value to the organisation and its stakeholders through supporting the organisation's objectives by:

- providing a framework for an organisation that enables future activity to take place in a consistent and controlled manner
- improving decision making, planning and prioritisation by comprehensive and structured understanding of business activity, volatility and project opportunity/threat
- contributing to more efficient use/allocation of capital and resources within the organisation
- reducing volatility in the non essential areas of the business
- protecting and enhancing assets and company image
- developing and supporting people and the organisation's knowledge base
- optimising operational efficiency

# The Risk Management Process

# Risk Assessment

Risk Assessment is defined by the ISO/ IEC Guide 73 as the overall process of risk analysis and risk evaluation.

# Risk Analysis

Risk identification sets out to identify an organisation's exposure to uncertainty. This requires an intimate knowledge of the organisation, the market in which it operates, the legal, social, political and cultural environment in which it exists, as well as the development of a sound understanding of its strategic and operational objectives, including factors critical to its success and the threats and opportunities related to the achievement of these objectives.

Risk identification should be approached in a methodical way to ensure that all significant activities within the organisation have been identified and all the risks flowing from these activities defined.

All associated volatility related to these activities should be identified and categorised.

- Financial - These concern the effective management and control of the finances of the organisation and the effects of external factors such as availability of credit, foreign exchange rates, interest rate movement and other market exposures.

Knowledge management - These concern the effective management and control of the knowledge resources, the production, protection and communication thereof.

External factors might include the unauthorised use or abuse of intellectual property, area power failures, and competitive technology. Internal factors might be system malfunction or loss of key staff

Compliance - These concern such issues as health & safety, environmental, trade descriptions, consumer protection, data protection, employment practices and regulatory issues.

Whilst risk identification can be carried out by outside consultants, an in-house approach with well communicated, consistent and coordinated processes and tools is likely to be more effective. In-house 'ownership' of the risk management process is essential.

# Risk Description

The objective of risk description is to display the identified risks in a structured format, for example, by using a table. The risk description table overleaf can be used to facilitate the description and assessment of risks. The use of a well designed structure is necessary to ensure a comprehensive risk identification, description and assessment process.

# Risk Description

By considering the consequence and probability of each of the risks set out in the table, it should be possible to prioritise the key risks that need to be analysed in more detail. Identification of the risks associated with business activities and decision making may be categorised as strategic, project/tactical, operational. It is important to incorporate risk management at the conceptual stage of projects as well as throughout the life of a specific project.

# Risk Description

1. Name of Risk	
2. Scope of Risk	Qualitative description of the events, their size, type, number and dependencies
3. Nature of Risk	Eg. strategic, operational, financial, knowledge or compliance
4. Stakeholders	Stakeholders and their expectations
5. Quantification of Risk	Significance and Probability
6. Risk Tolerance/ Appetite	Loss potential and financial impact of risk Value at risk Probability and size of potential losses/gains Objective(s) for control of the risk and desired level of performance
7. Risk Treatment & Control Mechanisms	Primary means by which the risk is currently managed Levels of confidence in existing control Identification of protocols for monitoring and review
8. Potential Action for Improvement	Recommendations to reduce risk
9. Strategy and Policy Developments	Identification of function responsible for developing strategy and policy

# Risk Estimation Monitoring

Risk estimation can be quantitative, semiquantitative or qualitative in terms of the probability of occurrence and the possible consequence. For example, consequences both in terms of threats (downside risks) and opportunities (upside risks) may be high, medium or low. Probability may be high, medium or low but requires different definitions in respect of threats and opportunities

# Consequences - Both Threats and Opportunities

High	Financial impact on the organisation is likely to exceed £x Significant impact on the organisation's strategy or operational activities Significant stakeholder concern
Medium	Financial impact on the organisation likely to be between £x and £y Moderate impact on the organisation's strategy or operational activities Moderate stakeholder concern
Low	Financial impact on the organisation likely to be less than £y Low impact on the organisation's strategy or operational activities Low stakeholder concern

# Probability of Occurrence - Threats

Estimation	Description	Indicators
High (Probable)	Likely to occur each year or more than 25% chance of occurrence.	Potential of it occurring several times within the time period (for example - ten years). Has occurred recently.
Medium (Possible)	Likely to occur in a ten year time period or less than 25% chance of occurrence.	Could occur more than once within the time period (for example - ten years). Could be difficult to control due to some external influences. Is there a history of occurrence?
Low (Remote)	Not likely to occur in a ten year period or less than 2% chance of occurrence.	Has not occurred. Unlikely to occur.

# Probability of Occurrence - Opportunities

Estimation	Description	Indicators
High (Probable)	Favourable outcome is likely to be achieved in one year or better than 75% chance of occurrence.	Clear opportunity which can be relied on with reasonable certainty, to be achieved in the short term based on current management processes.
Medium (Possible)	Reasonable prospects of favourable results in one year of 25% to 75% chance of occurrence.	Opportunities which may be achievable but which require careful management. Opportunities which may arise over and above the plan.
Low (Remote)	Some chance of favourable outcome in the medium term or less than 25% chance of occurrence.	Possible opportunity which has yet to be fully investigated by management. Opportunity for which the likelihood of success is low on the basis of management resources currently being applied.

# Risk Analysis methods and techniques

A range of techniques can be used to analyse risks. These can be specific to upside or downside risk or be capable of dealing with both.

# Risk Analysis methods and techniques

## Risk Identification Techniques - examples

- Brainstorming
- Questionnaires
- Business studies which look at each business process and describe both the internal processes and external factors which can influence those processes
- Industry benchmarking
- Scenario analysis
- Risk assessment workshops
- Incident investigation
- Auditing and inspection
- HAZOP (Hazard & Operability Studies)

# Risk Analysis methods and techniques

Both

- Dependency modelling
- SWOT analysis (Strengths, Weaknesses, Opportunities, Threats)
- Event tree analysis
- Business continuity planning
- BPEST (Business, Political, Economic, Social, Technological) analysis
- Real Option Modelling
- Decision taking under conditions of risk and uncertainty
- Statistical inference
- Measures of central tendency and dispersion
- PESTLE (Political Economic Social Technical Legal Environmental)

# Risk Analysis methods and techniques

## Downside risk

- Threat analysis
- Fault tree analysis
- FMEA (Failure Mode & Effect Analysis)

# Risk Profile

The result of the risk analysis process can be used to produce a risk profile which gives a significance rating to each risk and provides a tool for prioritising risk treatment efforts. This ranks each identified risk so as to give a view of the relative importance.

# Risk Profile

This process allows the risk to be mapped to the business area affected, describes the primary control procedures in place and indicates areas where the level of risk control investment might be increased, decreased or reapportioned.

Accountability helps to ensure that 'ownership' of the risk is recognised and the appropriate management resource allocated.

# Risk Evaluation

When the risk analysis process has been completed, it is necessary to compare the estimated risks against risk criteria which the organisation has established. The risk criteria may include associated costs and benefits, legal requirements, socio-economic and environmental factors, concerns of stakeholders, etc.

Risk evaluation therefore, is used to make decisions about the significance of risks to the organisation and whether each specific risk should be accepted or treated.

# Risk Treatment

Risk treatment is the process of selecting and implementing measures to modify the risk. Risk treatment includes as its major element, risk control/mitigation, but extends further to, for example, risk avoidance, risk transfer, risk financing, etc.

# Risk Treatment

Any system of risk treatment should provide as a minimum:

- effective and efficient operation of the organisation
- effective internal controls
- compliance with laws and regulations

# Risk Treatment

The risk analysis process assists the effective and efficient operation of the organisation by identifying those risks which require attention by management. They will need to prioritise risk control actions in terms of their potential to benefit the organisation.

# Risk Treatment

Effectiveness of internal control is the degree to which the risk will either be eliminated or reduced by the proposed control measures.

Cost effectiveness of internal control relates to the cost of implementing the control compared to the risk reduction benefits expected.

# Risk Treatment

The proposed controls need to be measured in terms of potential economic effect if no action is taken versus the cost of the proposed action(s) and invariably require more detailed information and assumptions than are immediately available.

# Risk Treatment

Firstly, the cost of implementation has to be established. This has to be calculated with some accuracy since it quickly becomes the baseline against which cost effectiveness is measured. The loss to be expected if no action is taken must also be estimated and by comparing the results, management can decide whether or not to implement the risk control measures.

# Risk Treatment

Compliance with laws and regulations is not an option. An organisation must understand the applicable laws and must implement a system of controls to achieve compliance. There is only occasionally some flexibility where the cost of reducing a risk may be totally disproportionate to that risk.

# Risk Treatment

One method of obtaining financial protection against the impact of risks is through risk financing which includes insurance. However, it should be recognised that some losses or elements of a loss will be uninsurable.

( the uninsured costs associated with work-related health, safety or environmental incidents, which may include damage to employee morale and the organisation's reputation.)

# Risk Reporting and Communication

## Internal Reporting

Different levels within an organisation need different information from the risk management process.

The Board of Directors should:

- know about the most significant risks facing the organisation
- know the possible effects on shareholder value of deviations to expected performance ranges
- ensure appropriate levels of awareness throughout the organisation
- know how the organisation will manage a crisis
- know the importance of stakeholder confidence in the organisation
- know how to manage communications with the investment community where applicable
- be assured that the risk management process is working effectively
- publish a clear risk management policy covering risk management philosophy and responsibilities

Business Units should:

- be aware of risks which fall into their area of responsibility, the possible impacts these may have on other areas and the consequences other areas may have on them have performance indicators which allow them to monitor the key business and financial activities, progress towards objectives and identify developments which require intervention (e.g. forecasts and budgets)
- have systems which communicate variances in budgets and forecasts at appropriate frequency to allow action to be taken
- report systematically and promptly to senior management any perceived new risks or failures of existing control measures

Individuals should:

- understand their accountability for individual risks
- understand how they can enable continuous improvement of risk management response
- understand that risk management and risk awareness are a key part of the organisation's culture
- report systematically and promptly to senior management any perceived new risks or failures of existing control measures

## External Reporting

A company needs to report to its stakeholders

on a regular basis setting out its risk management policies and the effectiveness in achieving its objectives.

Increasingly stakeholders look to organisations to provide evidence of effective management of the organisation's non-financial performance in such areas as community affairs, human rights, employment practices, health and safety and the environment.

Good corporate governance requires that companies adopt a methodical approach to risk management which:

- protects the interests of their stakeholders
- ensures that the Board of Directors discharges its duties to direct strategy, build value and monitor performance of the organisation
- ensures that management controls are in place and are performing adequately

The arrangements for the formal reporting of risk management should be clearly stated and be available to the stakeholders.

The formal reporting should address:

- the control methods – particularly management responsibilities for risk management
- the processes used to identify risks and how they are addressed by the risk management systems
- the primary control systems in place to manage significant risks
- the monitoring and review system in place

Any significant deficiencies uncovered by the system, or in the system itself, should be reported together with the steps taken to deal with them.

# The Structure and Administration of Risk Management

Furthermore, it should refer to any legal requirements for policy statements eg. For Health and Safety. Attaching to the risk management process is an integrated set of tools and techniques for use in the various stages of the business process.

To work effectively, the risk management process requires:

- commitment from the chief executive and executive management of the organisation
- assignment of responsibilities within the organisation
- allocation of appropriate resources for training and the development of an enhanced risk awareness by all stakeholders.

# The Structure and Administration of Risk Management

## Role of the Board

The Board has responsibility for determining the strategic direction of the organisation and for creating the environment and the structures for risk management to operate effectively.

This may be through an executive group, a nonexecutive committee, an audit committee or such other function that suits the organisation's way of operating and is capable of acting as a 'sponsor' for risk management.

- the costs and benefits of the risk and control activity undertaken
- the effectiveness of the risk management process
- the risk implications of board decisions

# The Structure and Administration of Risk Management

## Role of the Business Units

This includes the following:

- the business units have primary responsibility for managing risk on a day-to-day basis
- business unit management is responsible for promoting risk awareness within their operations; they should introduce risk management objectives into their business
- risk management should be a regular management-meeting item to allow consideration of exposures and to reprioritise work in the light of effective risk analysis
- business unit management should ensure that risk management is incorporated at the conceptual stage of projects as well as throughout a project

## Role of the Risk Management Function

Depending on the size of the organisation the risk management function may range from a single risk champion, a part time risk manager, to a full scale risk management department.

The role of the Risk Management function should include the following:

- setting policy and strategy for risk management
- primary champion of risk management at strategic and operational level
- building a risk aware culture within the organisation including appropriate Education

- establishing internal risk policy and structures for business units
- designing and reviewing processes for risk management
- co-ordinating the various functional activities which advise on risk management issues within the organisation
- developing risk response processes, including contingency and business continuity programmes
- preparing reports on risk for the board and the stakeholders

## Role of Internal Audit

The role of Internal Audit is likely to differ from one organisation to another. In practice, Internal Audit's role may include some or all of the following:

- focusing the internal audit work on the significant risks, as identified by management, and auditing the risk management processes across an organisation
- providing assurance on the management of risk
- providing active support and involvement in the risk management process
- facilitating risk identification/assessment and educating line staff in risk management and internal control
- co-ordinating risk reporting to the board, audit committee, etc

In determining the most appropriate role for a particular organisation, Internal Audit should ensure that the professional requirements for independence and objectivity are not breached.

# Resources and Implementation

The resources required to implement the organisation's risk management policy should be clearly established at each level of management and within each business unit.

In addition to other operational functions they may have, those involved in risk management should have their roles in co-ordinating risk management policy/strategy clearly defined.

The same clear definition is also required for those involved in the audit and review of internal controls and facilitating the risk management process.

# Resources and Implementation

Risk management should be embedded within the organisation through the strategy and budget processes. It should be highlighted in induction and all other training and development as well as within operational processes e.g. product/service development projects.

# Monitoring and Review of the Risk Management Process.

Effective risk management requires a reporting and review structure to ensure that risks are effectively identified and assessed and that appropriate controls and responses are in place. Regular audits of policy and standards compliance should be carried out and standards performance reviewed to identify opportunities for improvement. It should be remembered that organisations are dynamic and operate in dynamic environments. Changes in the organisation and the environment in which it operates must be identified and appropriate modifications made to systems.

# Monitoring and Review of the Risk Management Process.

The monitoring process should provide assurance that there are appropriate controls in place for the organisation's activities and that the procedures are understood and followed. Changes in the organisation and the environment in which it operates must be identified and appropriate changes made to systems.

# Monitoring and Review of the Risk Management Process.

Any monitoring and review process should also determine whether:

- the measures adopted resulted in what was intended
- the procedures adopted and information gathered for undertaking the assessment were appropriate
- improved knowledge would have helped to reach better decisions and identify what lessons could be learned for future assessments and management of risks

**THANK YOU FOR ATTENTION**
