

# V. Ввод – вывод

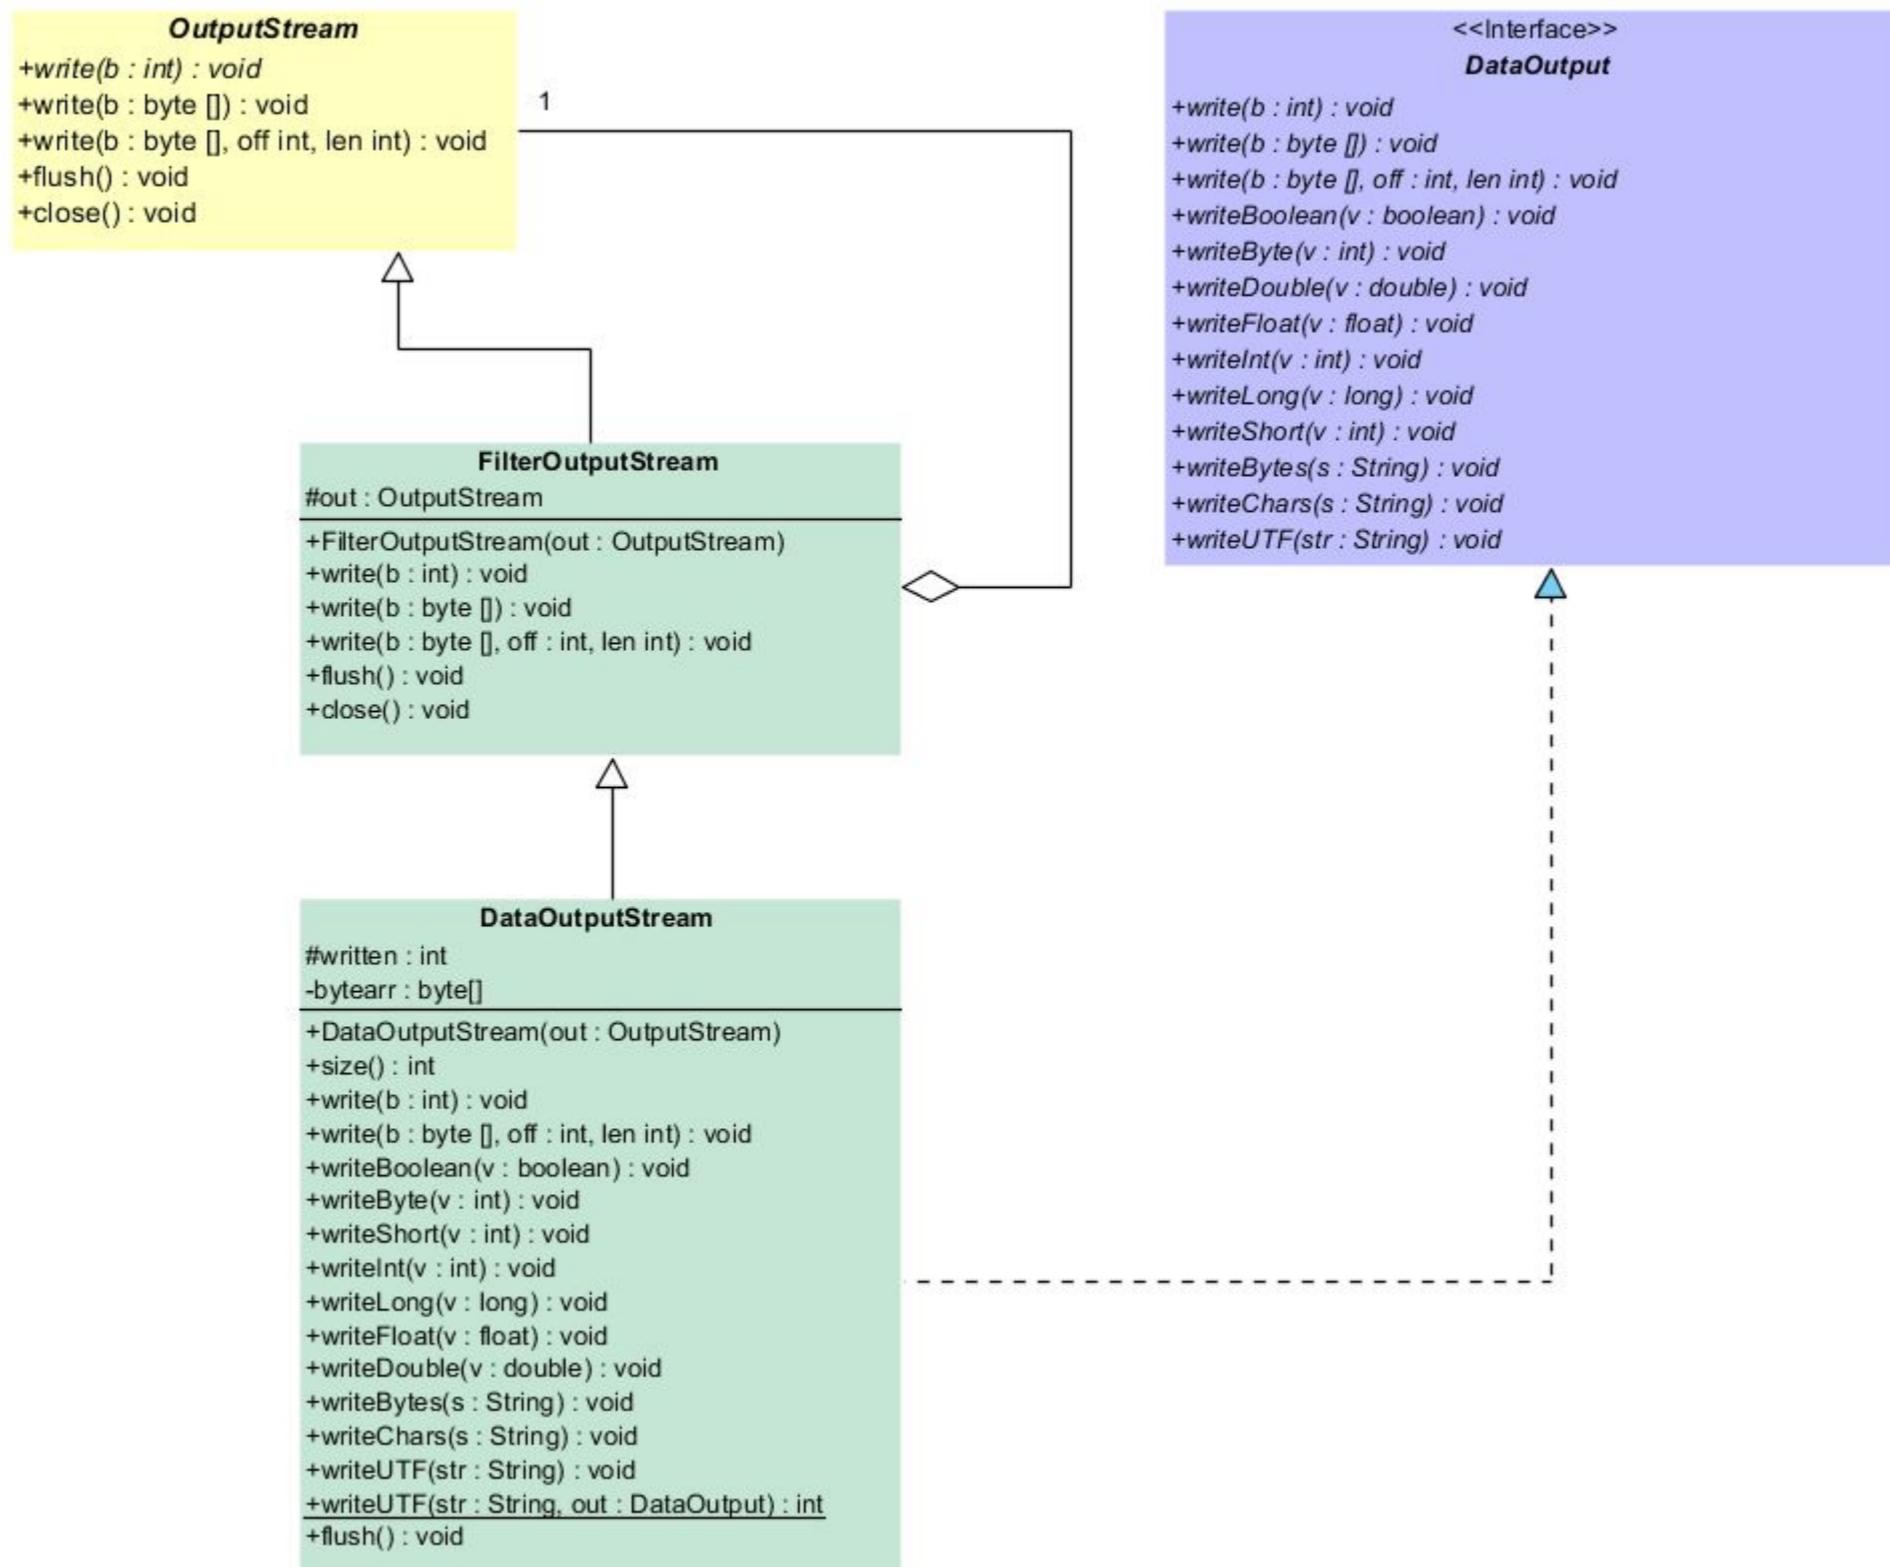

## 4. Потоки данных

Объект из которого можно последовательно прочитать значения примитивных типов называется поток ввода данных. Объект в который можно последовательно записать значения примитивных типов называется поток вывода данных. Классом для потоков ввода данных является класс `DataInputStream`, а потоков вывода данных класс `DataOutputStream`. Классы потоков данных находятся в пакете `java.io`.

# Потоки вывода данных

# Класс DataOutputStream

# Класс DataOutputStream

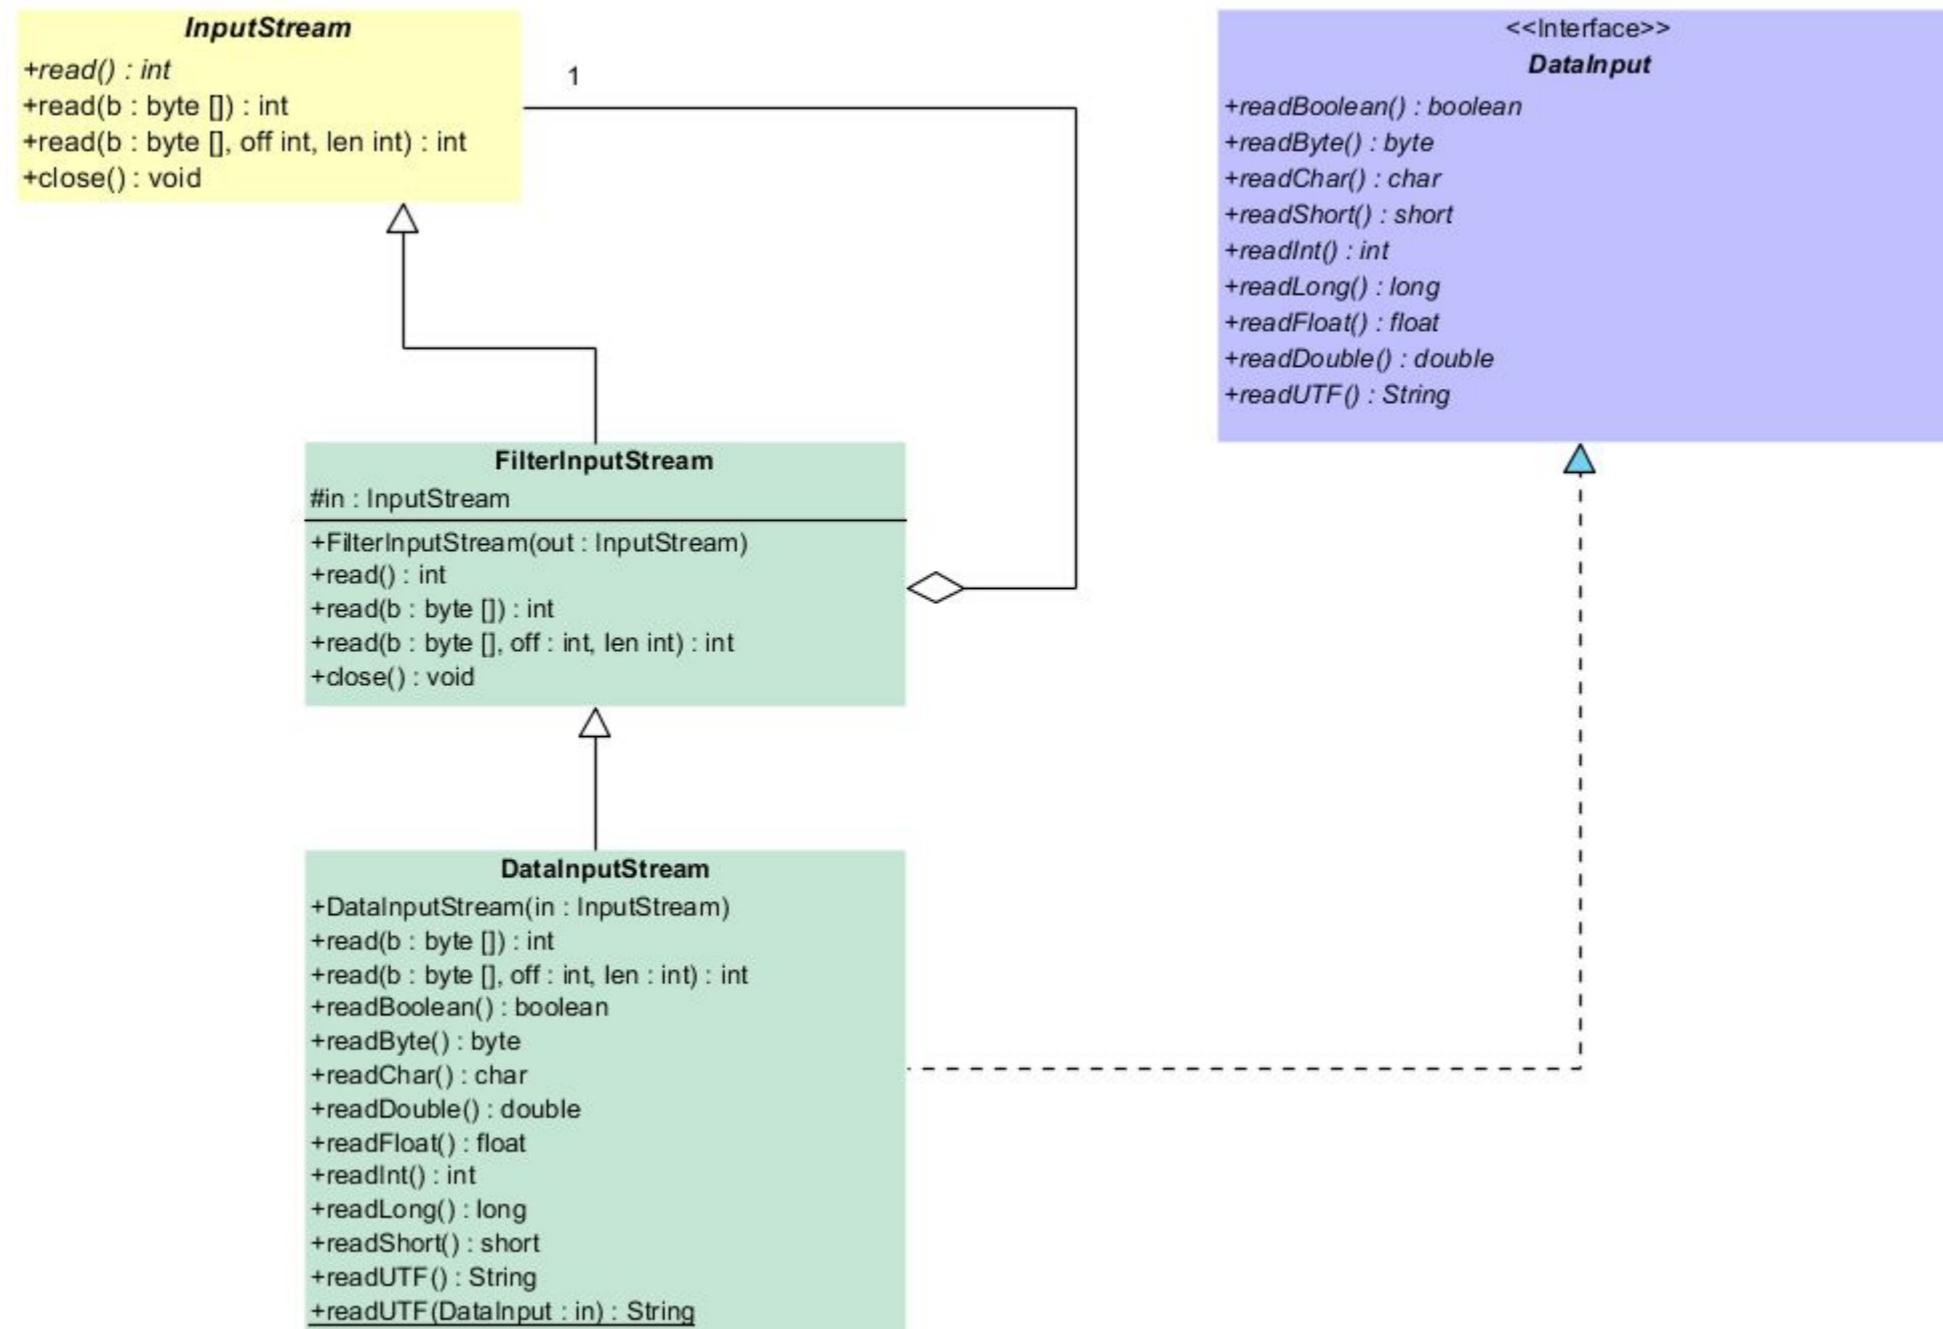

```
public class DataOutputStream extends FilterOutputStream {  
  
    protected int written;  
    private byte[] bytarr = null;  
  
    public final int size()  
  
    public DataOutputStream(OutputStream out)  
  
    private void incCount(int value)  
  
    public final void writeBoolean(boolean v)  
    public final void writeByte(int v)  
    public final void writeShort(int v)  
    public final void writeChar(int v)  
    public final void writeInt(int v)  
    public final void writeLong(long v)  
    public final void writeFloat(float v)  
    public final void writeDouble(double v)  
  
    public final void writeBytes(String s)  
    public final void writeChars(String s)  
    public final void writeUTF(String str)  
    static int writeUTF(String str, DataOutput out)  
  
    public void flush()  
}
```

Класс DataOutputStream предназначен для превращения примитивов и строк в последовательность байтов и запись этой последовательности в байтовый поток вывода. Байтовый поток вывода задаётся в конструкторе. Класс позволяет хранить и получать число записанных байт.

# Потоки ввода данных

# Класс DataInputStream

```
public class DataInputStream extends FilterInputStream implements DataInput {  
  
    public DataInputStream(InputStream in)  
  
    public final int read(byte b[])  
    public final int read(byte b[], int off, int len)  
  
    public final boolean readBoolean()  
    public final byte readByte()  
    public final short readShort()  
    public final int readInt()  
    public final long readLong()  
    public final float readFloat()  
    public final double readDouble()  
    public final String readUTF()  
    public final static String readUTF(DataInput in)  
}
```

Класс DataInputStream предназначен для чтения примитивов и строк из байтового потока ввода. Байтовый поток ввода задаётся в конструкторе.

# Запись и чтение значений примитива int

# Запись int в файл

```
public class WriteIntDemo {  
  
    public static void main(String[] args) {  
  
        String file = "I:\\FileIO\\writeint.txt";  
  
        FileOutputStream fos = null;  
        DataOutputStream dos = null;  
  
        try {  
  
            fos = new FileOutputStream(file);  
            dos = new DataOutputStream(fos);  
  
            for (int i = 0; i < 64; i++) {  
                dos.writeInt(i);  
                System.out.println(Integer.toBinaryString(i) + " ");  
            }  
        } catch (IOException e) {  
            System.out.println("An I/O error occurred");  
        } finally {  
            try {  
                if (dos != null) {  
                    dos.close();  
                }  
            } catch (IOException e) {  
                System.out.println("Error closing file");  
            }  
        }  
    }  
}
```
