

The background of the slide is a light gray gradient with several realistic water droplets of various sizes scattered across it. The droplets have highlights and shadows, giving them a three-dimensional appearance. The main title is centered horizontally.

THE RAINFORESTS OF THE SEA

Coral looks like rock, but it is actually a huge collection of tiny clear animals called coral polyps.

The bright colour of coral comes from tiny sea plants called algae. Coral and algae depend on each other to live.

Today, many coral reefs are dying and there are many reasons why. First of all, the oceans are getting warmer. This kills the algae and so the coral reefs lose their colour and food.

If we don't take action, all the reefs will die in around 20 years. We can help save the world's coral reefs by joining an environmental organization like Reef Relief.
