

A microscopic view of a blood vessel showing several red blood cells. The cells are biconcave discs, some appearing normal and others appearing smaller or more irregular in shape, which is characteristic of anemia. The background is a reddish, textured surface representing the vessel wall.

# Anemia in children

EPO  
produced  
in kidney

Non-EPO  
Receptor

EPO  
Receptor

Reticulocytes  
(Immature  
Red Blood Cells)

Increased  
Red Blood Cells  
in peripheral  
circulation

Stem Cells

Bone  
Marrow

PBI-1402

Blood smear in which the red cells show variation in size and shape typical of sickle-cell anemia.

(A) Long, thin, deeply stained cells with pointed ends are irreversibly sickled.

(B) Small, round, dense cells are hyperchromic because a part of the membrane is lost during sickling.

(C) Target cell with a concentration of hemoglobin on its centre.

(D) Lymphocyte.

(E) Platelets.

## AVERAGE NORMAL BLOOD VALUES AT DIFFERENT AGE GROUPS

<b>AGE</b>	<b>Hb (gm %)</b>	<b>RBC (m/L)</b>	<b>HCT %</b>	<b>MCV (cu.mm)</b>	<b>MCH (pg)</b>	<b>MCHC %</b>	<b>Retic %</b>
<b>1 day</b>	<b>18.0</b>	<b>5.14</b>	<b>61</b>	<b>119</b>	<b>36.0</b>	<b>31.6</b>	<b>32</b>
<b>4 weeks</b>	<b>14.2</b>	<b>4.0</b>	<b>43</b>	<b>106</b>	<b>35.5</b>	<b>33.5</b>	<b>0.6</b>
<b>1 year</b>	<b>11.6</b>	<b>4.6</b>	<b>35</b>	<b>77</b>	<b>25.0</b>	<b>33.0</b>	<b>0.9</b>
<b>10-12 years</b>	<b>13.0</b>	<b>4.8</b>	<b>39</b>	<b>80</b>	<b>27.0</b>	<b>33.0</b>	<b>1.0</b>

# CLASSIFICATION AND AETIOLOGY OF ANEMIA :

There are four basic causes of anemia - **loss, destruction, sequestration and hypoproduction.**

Anemia can be further classified by RBC size - **micro, normo, and macrocytic anemia.**

RBC shape - **e.g. Sickle cell.**

## Etiology

Blood loss : Acute      Chronic

Decreased iron assimilation : Nutritional deficiency

Hypoplastic or aplastic anemia

Bone marrow infiltration like leukemia & other malignancies, myelodysplastic syndrome

Dyserythropoietic anemia

## Increased physiologic requirement

Extracorporeal like alloimmune & isoimmune hemolytic anemia, microangiopathic anemias, infections, hypersplenism, Intracorporeal defect like :

**Red cell membranopathy i.e.** congenital spherocytosis, elliptocytosis

Hemoglobinopathy like HbS, C,D,E etc.

Thalassemia syndrome

RBC enzymopathies like G6PD deficiency, PK deficiency etc.

# Symptoms of Anemia

**Red = In severe anemia**

## Eyes

- Yellowing

## Skin

- Paleness
- Coldness
- Yellowing

## Respiratory

- Shortness of breath

## Muscular

- Weakness

## Intestinal

- Changed stool color

## Central

- Fatigue
- Dizziness
- **Fainting**

## Blood vessels

- Low blood pressure

## Heart

- Palpitations
- Rapid heart rate
- **Chest pain**
- **Angina**
- **Heart attack**

## Spleen

- Enlargement

## Etiology

### *B Thalassemia*

- Family Hz, mild anemia, Mediterranean, Asian, or African Heritage
- **TRAIT**: single defect in B-globin gene results in less normal B-globin chains
- Decrease HG A1
- Autosomal Recessive
- **B MAJOR**: little to no prod. of B chain of HG A1
- Noted > 6months when gamma chain and Hg F prod. usually fall

### *A Thalassemia*

- **Silent Carrier**: 1 gene
- **A Thal Trait**: Asian Africans, 2 genes
- **Hb H Disease**: 3 genes which causes a lack of A chains
- **Bart's Hemoglobinopathy**: 4 genes leads to catastrophic anemia and Hydrops fetalis

# HEREDITARY SPHEROCYTOSIS

RBC membrane defect with **SPECTRIN**

RBC destroyed prematurely in spleen

**MOST COMMON HEREDITARY RED CELL DISORDER!!!!!!**

Autosomal Dominant

Increased RBC turnover leads to **cholelithiasis** and **cholecystitis**

Susceptible to aplastic crisis from **PARVOvirus**

Physical shows pallor, jaundice, splenomegaly

Lab findings include reticulocytosis, increased MCHC (decreased in IDA), spherocytes in smear.

Antiglobulin test rules out an immune cause for the HA

**Osmotic fragility test**

Tx includes careful management of situation, esp. aplastic crisis

**Splenectomy:** spherocytes remain but RBC destruction stops! **(only after 5 yrs old)**

Immunize prior to procedure with **Hib**, **Pneumovax**, and **N. meningitis vaccine** b/c increase risk for encapsulated organisms.

Also penicillin prophylaxis

# AREGENERATIVE ANEMIAS

- ***Parvo B19***
- Fifth's Disease with affinity for red cell precursors causing marrow aplasia
- Causes Hydrops Fetalis

## ***Diamond-Blackfan Anemia***

Relative insensitivity to EPO (idiopathic)

Develops **insidiously** in 1st year of life **and no recovery!**

**Short stature, abnormal facies, abnormal thumbs**

**Macrocytosis (any anemic child with Macrocytosis is very serious)**

**Tx includes transfusions, steroids for life**

Increase risk of myelogenous leukemia

## ***Transient Erythroblastopenia of Childhood***

2nd yr of life and is idiopathic

**VERY low Hbn but no symptoms**

**Recover with no intervention at all!**

Normochromic/normocytic anemia

# **SICKLE CELL DISEASE**

## **Etiology:**

**Valine for glutamic Acid in 6th position of Beta chain Hb**

- Most common in African descent**
- Only appears after 6 months when B chains have fully developed into Hb A1.**
- Defect on Chrom 11 Neonatal screening!!!**

# G6PD DEFICIENCY

- Central enzyme in PPP pathway
- Makes NADPH which forms reduced Glutathione that removes radicals
- **X-Linked**
- **A form** is common in AA and mild
- **B form** in Meds and very serious
- **Canton form** in oriental and rare but most serious

Microcytic Anemia -  
Hypochromia, Target Cells,  
Microcyte

Normocytic Normochromic - Hemolytic  
Anemia

Megaloblastic Anemia, Bone marrow smear, May-Giemsa stain, x1000

Pernicious Anemia, Bone marrow smear, May-Giemsa stain, x1000
