

How will technology  
change our lives in  
the next 20 years?

New technologies are creating every day in our world. I think that in 20 years will be creating technologies which now seem impossible.

# Aspects of life

- Robots-assistants: people will create robots that will work in different professions, such as a teacher or a doctor. Also robots are stronger than people and will be able to do the work that people cannot do.
- New transport: In the future, there will be new models of transport, such as self-driving cars.
- Medicine: scientists will be able to find a cure for epidemics.

# Conclusion

Due to new technologies, people will be able to explore solve global problems, such as hunger, or explore space.

I think that in the future not only new technologies will be created, but also old technologies will be changed, because it will allow people to better understand the future technologies.
