General Information

- In computing, a computer keyboard is a typewriter-style device which uses an arrangement of buttons or keys to act as a mechanical lever or electronic switch.
- A keyboard typically has characters engraved or printed on the keys and each press of a key typically corresponds to a single written symbol.
- In normal usage, the keyboard is used as a text entry interface to type text and numbers into a word processor, text editor or other programs.

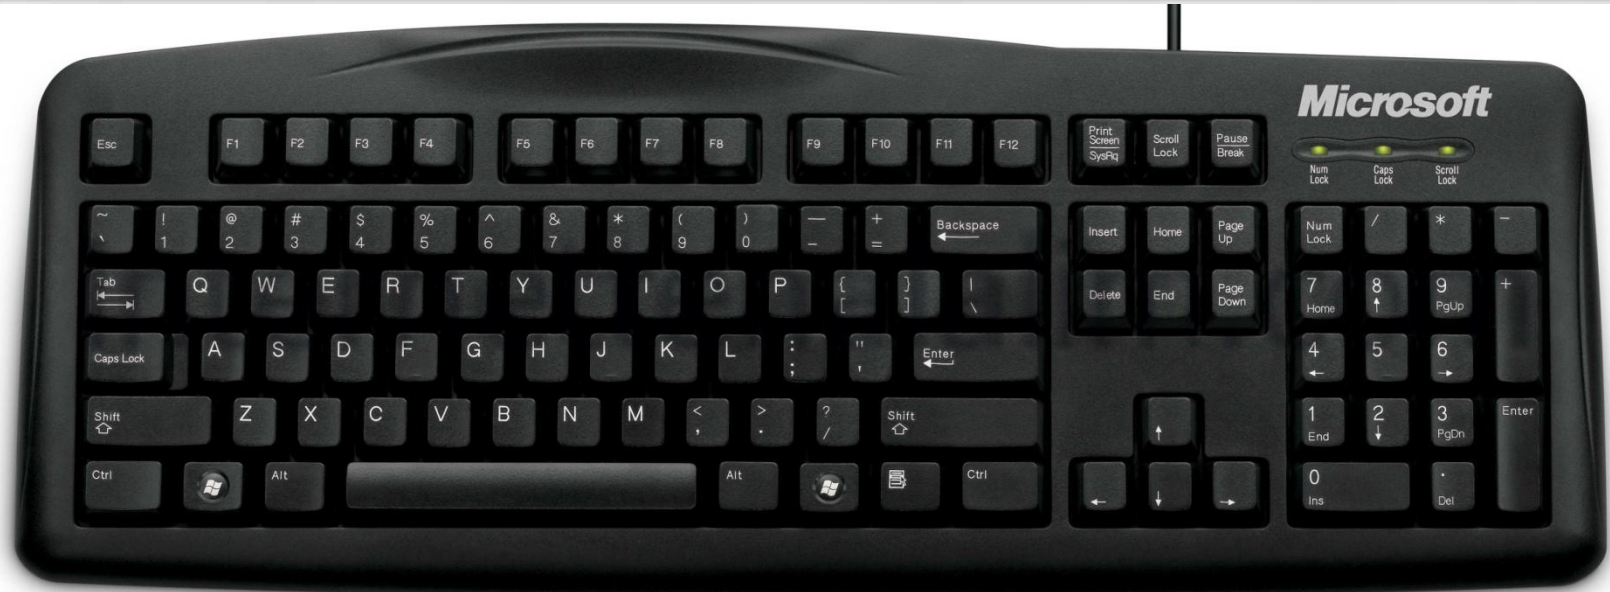

History

- The computer keyboard as a device for electromechanical data entry and communication derives largely from the utility of two devices: teleprinters (or teletypes) and keypunches.

Standard Keyboard

Laptop-size

- The keyboards on laptops usually have a shorter travel distance and a reduced set of keys.

Flexible Keyboards

Handheld Keyboard

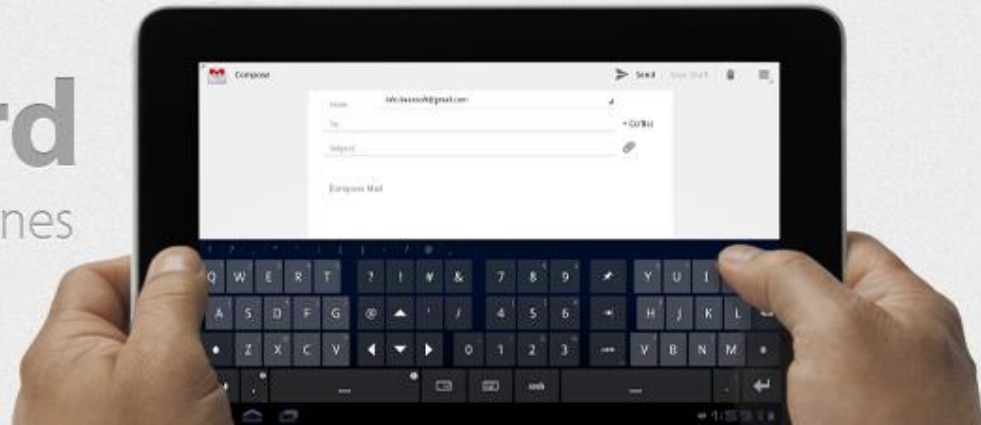

Thumb-size Keyboard
