

Loch Ness Monster

Eleva
Angelika

Loch ness is a place where perhaps one of the most famous monsters in the world lives.

- ❑ People say that in the lake you can see a big monster-“Nessie”
- ❑ Someone saw large black hum on the surface of the lake, which then disappeared.

Does the Loch Ness monster exist?

1. Esotericists believe that the Loch Ness monster is an otherworldly entity that passes through the astral tunnels.
2. One of the most realistic versions place of residence of the creature are the underground arteries of the reservoir.
3. Another version, Nessie is a survivor of the plesiosaur, based on the similarity in appearance.

There are many stories when in good weather sailboats for no apparent reason, went to the bottom. Some witnesses saw the lake monster.

In ancient times, the story of water monsters that attacked people was spread among the people. They were called kelpies. Local residents remember that in childhood because of the monster they were forbidden to swim in the lake.

In 1791 in England were found the remains of an unknown marine animal and since then Nessie became associated with the plesiosaur.

Nessie - dinosaur with a huge long neck. He has a massive body, and instead of legs a few flippers, which are necessary for him to swim quickly. Its length is about 15 m, but the weight of 25 tons.

The Lochness monster has several theories of origin: There is a version that this creature is an unknown species of seals, fish or shellfish. In 2005 N. Clark put forward a version that Nessie-bathing layer, which is visible above the water part of the back and raised trunk. L. Piccardi believes that the monster is a consequence of hallucinations that occur as a result of the action of gases that appear due to seismic activity. Skeptics say that there is no Nessie, and people just saw the trunks of Scottish pine, which is in the water, then rise, then fall down

Scotland is known for its beautiful nature, green meadows and huge ponds. The Loch Ness Monster live in a huge deep and freshwater lake, which is 37 km from the city of Inverness. The maximum depth reaches 230 m. The water in the reservoir is muddy, because it has a lot of peat. The Loch Ness and Loch Ness Monster are a local attraction that attracts a huge number of tourists

Loch Ness about 110 thousand years ago was completely covered with a thick ice shield, so the science does not know the animals that could survive in such conditions. Some scientists believe that the lake has underground tunnels into the sea and Nessie could be saved because of this. The researchers determined that in the reservoir there is a seisha effect – it is invisible to the human eye underwater currents that are ways to change the pressure, wind and seismic phenomena. They can carry large objects with them, and people think that they move on their own.
