

# Part 1: Introduction

CSE 3461/5461

Reading: Chapter 1, Kurose and Ross

# Part I: Introduction

## Our goal:

- Get context, overview, “feel” of networking
- More depth, detail *later* in course
- Approach:
  - Descriptive
  - Use Internet as example

## Overview:

- What’s the Internet
- What’s a protocol?
- Network edge
- Network core
- Access net, physical media
- Performance: loss, delay
- Protocol layers, service models
- Backbones, NAPs, ISPs
- History

# Outline

- **What is the Internet?**
- Network Edge
- Network Core
- Delay, Loss, Throughput in Networks
- Protocol Layers, Service Models
- History

# What's the Internet: "Nuts and bolts" view

- Millions of connected computing devices:
  - *Hosts = end systems*
  - Running *network apps*
- *Communication links*
  - Fiber, copper, radio, satellite
  - Transmission rate: *bandwidth*
- *Packet switches*: forward packets (chunks of data)
  - *Routers and switches*

# “Cool” Internet Appliances

IP picture frame  
<http://www.ceiva.com/>

Web-enabled toaster +  
weather forecaster

Tweet-a-watt:  
monitor energy use

Internet  
refrigerator

Slingbox: watch,  
control cable TV remotely

Internet phones

# What's the Internet: "Nuts and Bolts" View

- **Internet: "network of networks"**
  - Loosely hierarchical
  - Public Internet versus private intranet
- **Protocols:** control sending, receiving of messages
  - e.g., TCP, IP, HTTP, FTP, PPP
- Internet standards
  - RFC: Request For Comments
  - IETF: Internet Engineering Task Force

# What's the Internet: A Service View

- *Infrastructure that provides services to applications:*
  - Web, VoIP, email, games, e-commerce, social nets, ...
- *Provides programming interface to apps*
  - Hooks that allow sending and receiving app programs to “connect” to Internet
  - Provides service options, analogous to postal service

# What's a Protocol? (1)

## Human Protocols:

- “What’s the time?”
  - “I have a question”
  - Introductions
- ... specific msgs sent
- ... specific actions taken when msgs received, or other events

## Network Protocols:

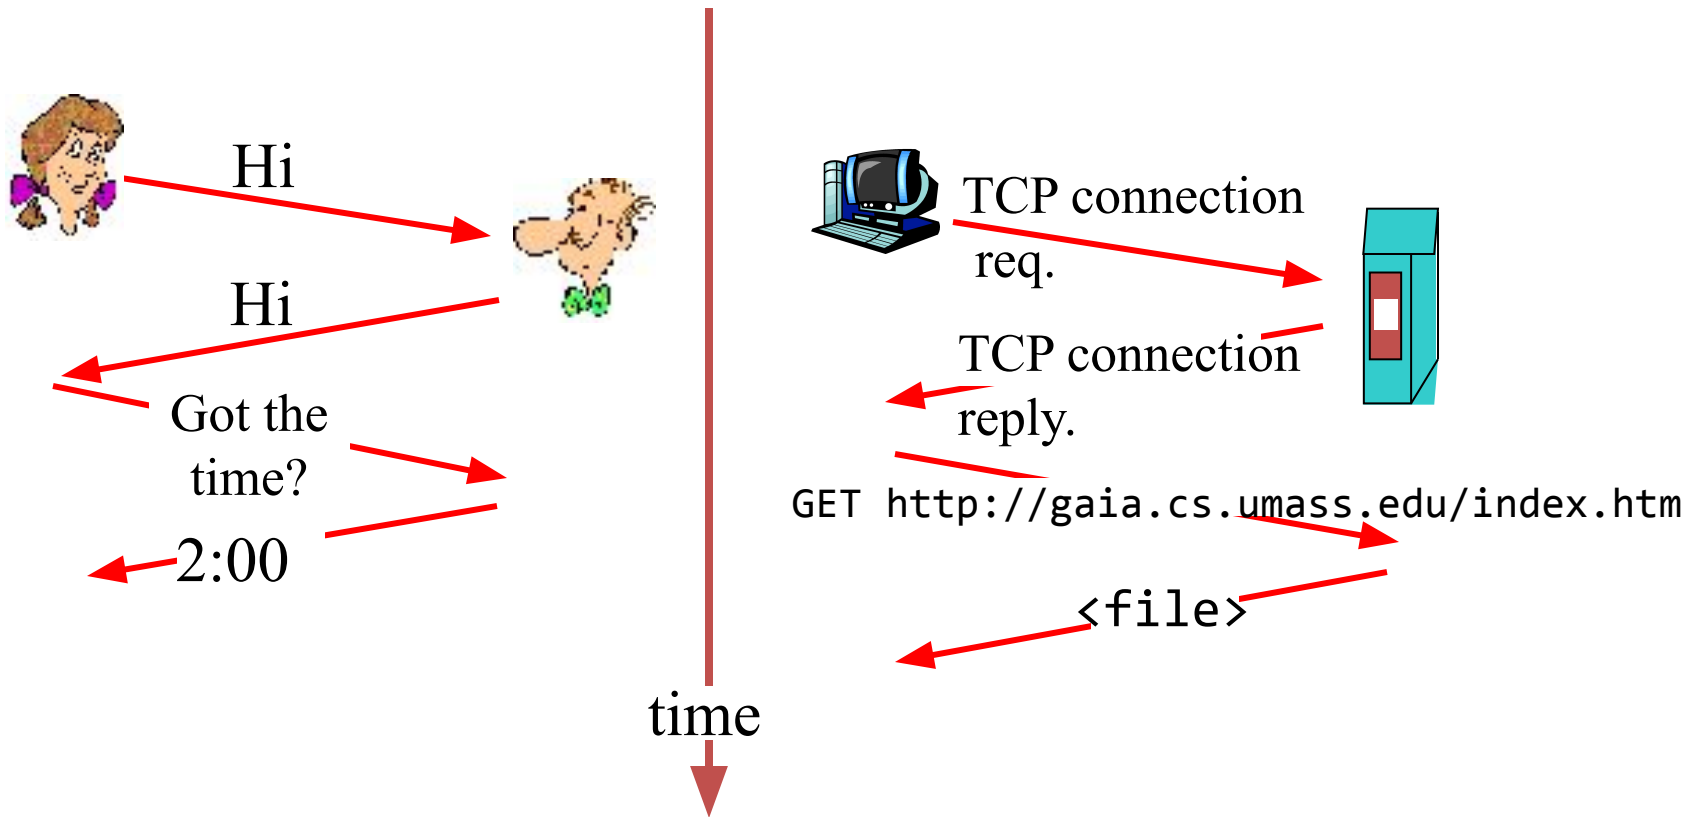

- Machines rather than humans
- All communication activity in Internet governed by protocols

*Protocols define **format, order** of **messages sent and received** among network entities, and **actions taken** on message transmission, receipt*

# What's a Protocol? (2)

Human protocol and computer network protocol:

Q: Other human protocols?

# Outline

- What is the Internet?
- **Network Edge**
- Network Core
- Delay, Loss, Throughput in Networks
- Protocol Layers, Service Models
- History

# Closer Look at Network Structure

- **Network edge:**  
Applications and hosts
- **Access networks, physical media:**  
Wired, wireless communication links
- **Network core:**
  - Routers
  - Network of networks

# The Network Edge

- **End systems (hosts):**

- Run application programs
- e.g., WWW, email
- at “edge of network”

- **Client/server model**

- Client host requests, receives service from server
- e.g., WWW client (browser)/server; email client/server

- **Peer-to-peer model:**

- Host interaction symmetric
- e.g.: Gnutella, KaZaA

# Network Edge: Connection-Oriented Service

- Goal:** Data transfer between end systems
- *Handshaking:* setup (prepare for) data transfer ahead of time
    - Hello, hello back human protocol
    - ***Set up “state”*** in two communicating hosts
  - TCP - Transmission Control Protocol
    - Internet’s connection-oriented service

## **TCP service** [RFC 793]

- *Reliable, in-order* byte-stream data transfer
  - Loss: acknowledgements and retransmissions
- *Flow control:*
  - Sender won’t overwhelm receiver
- *Congestion control:*
  - senders “slow down sending rate” when network congested

# Network Edge: Connectionless Service

**Goal:** Data transfer between end systems

– Same as before!

- **UDP** - User Datagram Protocol [RFC 768]: Internet's connectionless service
  - Unreliable data transfer
  - No flow control
  - No congestion control

## **Apps using TCP:**

- HTTP (WWW), FTP (file transfer), Telnet (remote login), SMTP (email)

## **Apps using UDP:**

- Streaming media, teleconferencing, Internet telephony

# Access Networks and Physical Media

*Q: How to connect end systems to edge router?*

- Residential access nets
  - Cable modem
- Institutional access networks (school, company)
  - Local area networks
- Mobile access networks

*Physical media*

- Coax, fiber
- Radio (e.g., WiFi)

# Outline

- What is the Internet?
- Network Edge
- **Network Core**
- Delay, Loss, Throughput in Networks
- Protocol Layers, Service Models
- History

# The Network Core

- Mesh of interconnected routers
- ***The fundamental question:*** how is data transferred through network?
  - **Circuit switching:** dedicated circuit per call – telephone network
  - **Packet switching:** data sent through network in discrete “chunks”

# Network Core: Circuit Switching (1)

## End-end resources reserved for “call”:

- Link bandwidth, switch capacity
- Dedicated resources: no sharing
- Circuit-like (guaranteed) performance
- Call setup required

# Network Core: Circuit Switching (2)

Network resources (e.g., bandwidth) **divided into “pieces”**

- Pieces allocated to calls
- Resource piece *idle* if not used by owning call (*no sharing*)
- Dividing link bandwidth into “pieces”
  - Frequency division
  - Time division

# Circuit Switching: FDM and TDM

FDM

Example:

4 users

TDM

# Network Core: Packet Switching (1)

## Each end-end data stream divided into *packets*

- Users A, B packets *share* network resources
- Each packet uses full link bandwidth
- Resources used *as needed*

## Resource contention:

- Aggregate resource demand can exceed amount available
- Congestion: packets queue, wait for link use
- Store and forward: packets move one hop at a time
  - Transmit over link
  - Wait turn at next link

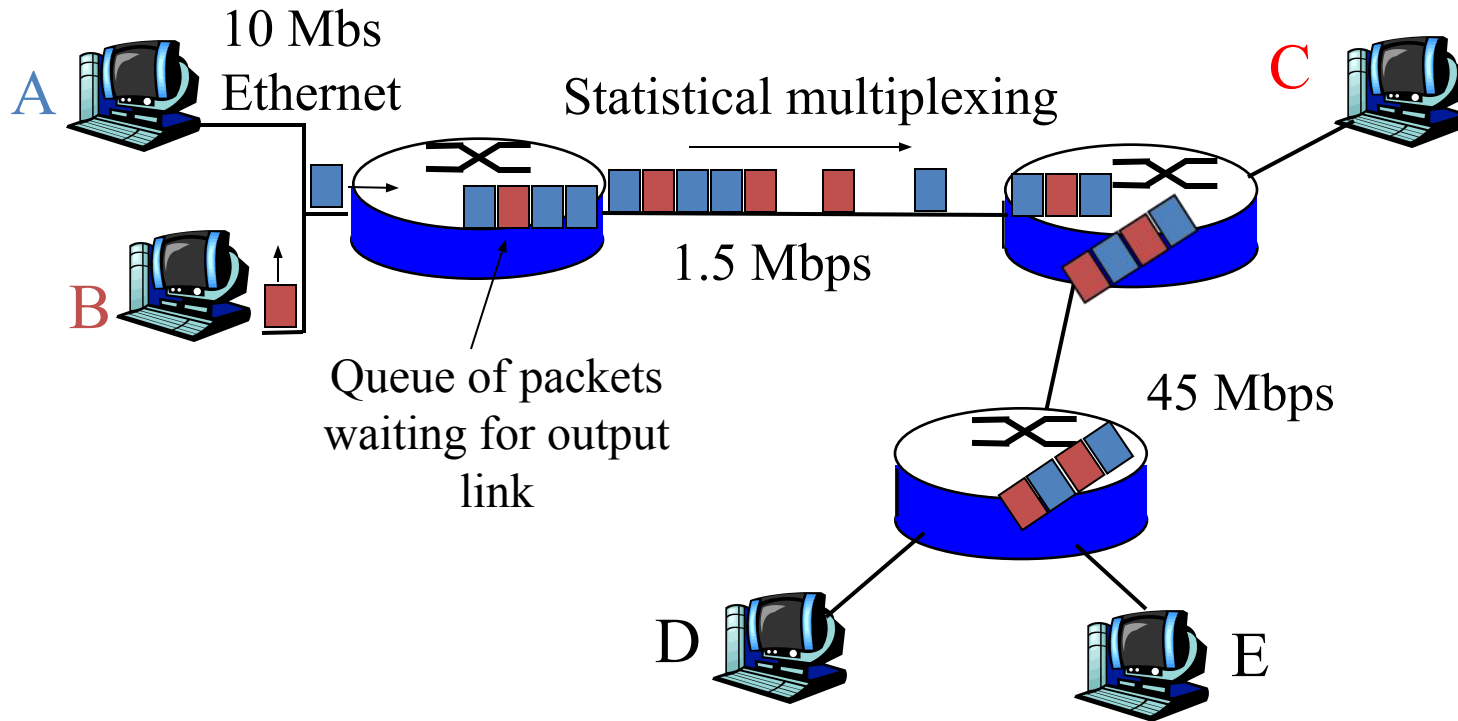

Bandwidth division into “pieces”

Dedicated allocation

Resource reservation

# Network Core: Packet Switching (2)

# Packet Switching Versus Circuit Switching

Packet switching allows more users to use network!

- 1 Mbit link
- Each user:
  - 100 Kbps when “active”
  - Active 10% of time
- Circuit switching:
  - 10 users
- Packet switching:
  - With 35 users,  
Probability {>10 active} < .0004

# Packet-Switched Networks: Routing

- **Goal:** Move packets among routers from source to destination
  - We'll study several path selection algorithms (chapter 4)
- **Datagram network:**
  - *Destination address* determines next hop
  - Routes may change during session
  - Analogy: driving, asking directions
- **Virtual circuit network:**
  - Each packet carries tag (virtual circuit ID), tag determines next hop
  - Fixed path determined at *call setup time*, remains fixed thru call
  - Routers maintain per-call state

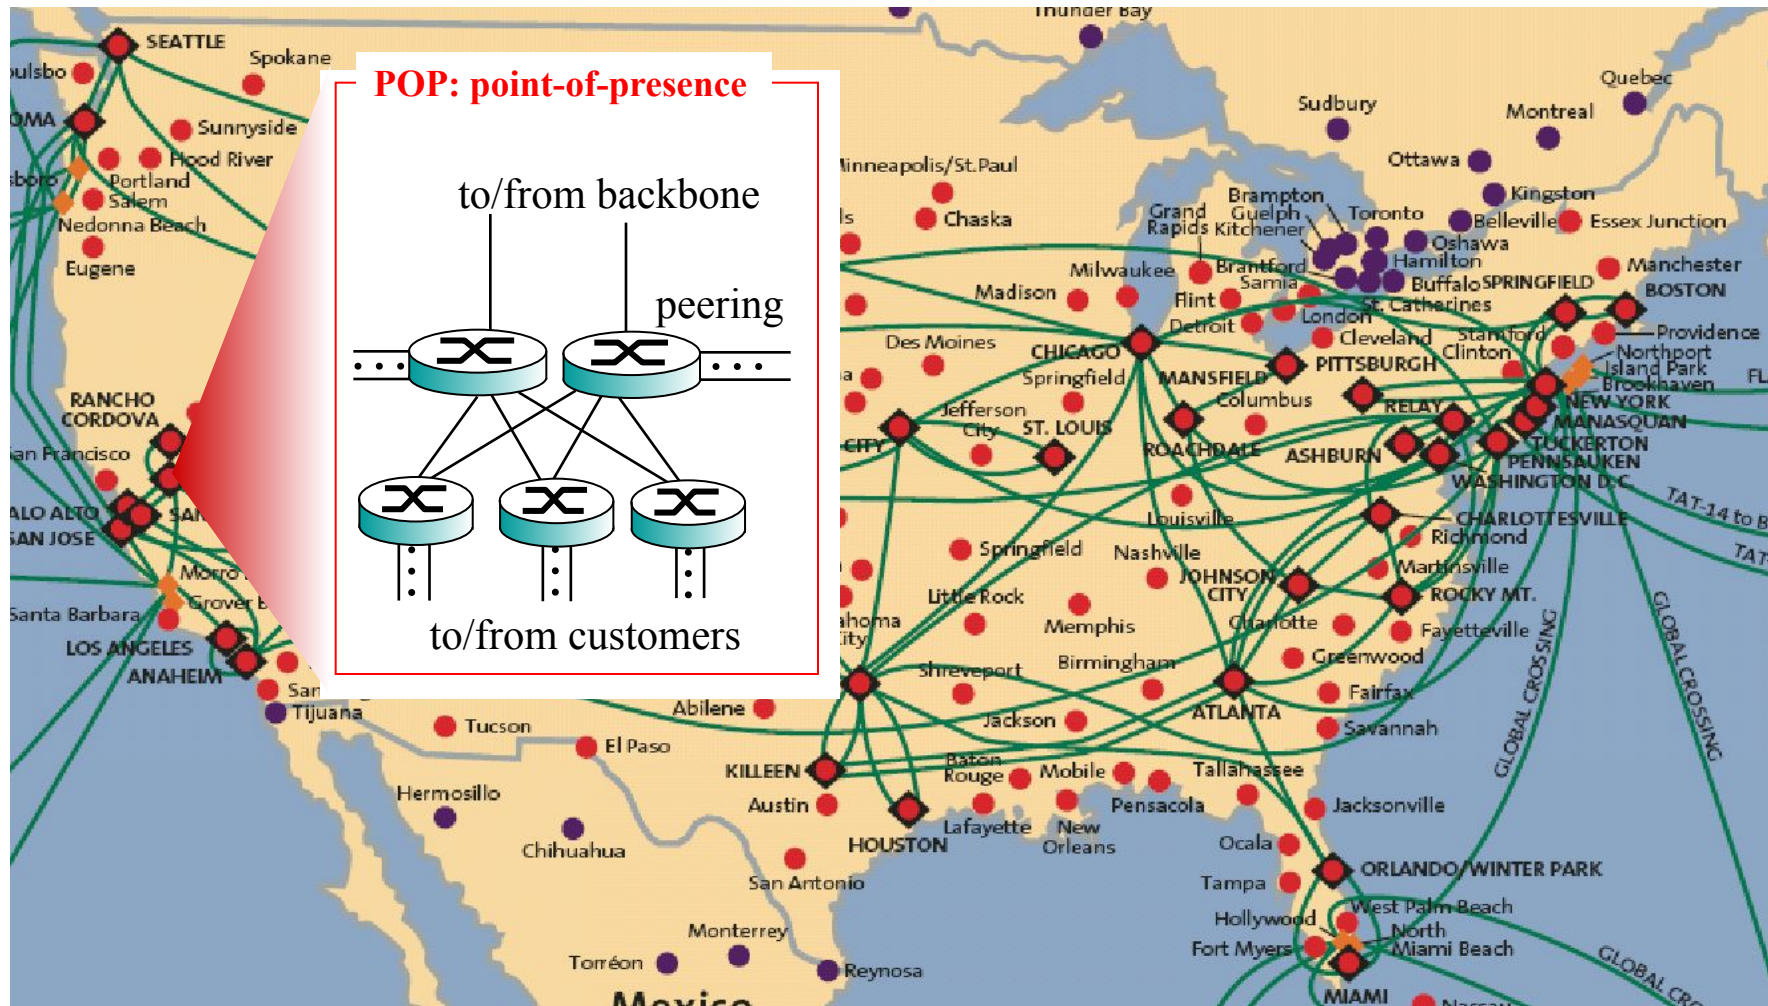

# Internet Structure: Network of Networks

- Roughly hierarchical
- **National/international backbone providers (NBPs)**
  - e.g. BBN/GTE, Sprint, AT&T, IBM, UUNet
  - Interconnect (peer) with each other privately, or at public Network Access Point (NAPs)
- **Regional ISPs**
  - connect into NBPs
- **Local ISP**, company
  - connect into regional ISPs

# National Backbone Provider

Example: Sprint

# Outline

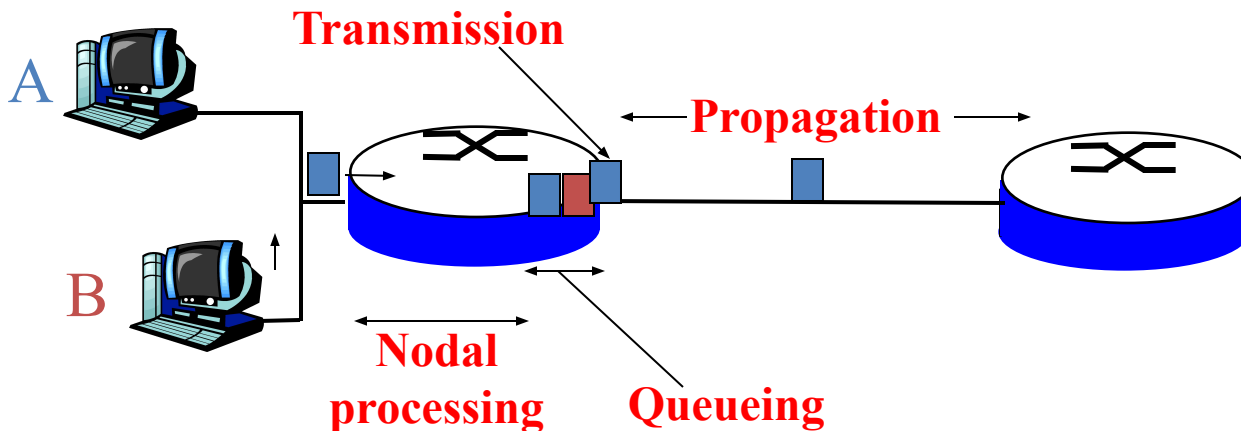

- What is the Internet?
- Network Edge
- Network Core
- **Delay, Loss, Throughput in Networks**
- Protocol Layers, Service Models
- History

# Delay in Packet-Switched Networks (1)

Packets experience **delay** on end-to-end path

- **Four** sources of delay at each hop

- **Nodal processing:**
  - Check bit errors
  - Determine output link
- **Queueing**
  - Time waiting at output link for transmission
  - Depends on congestion level of router

# Delay in Packet-Switched Networks (2)

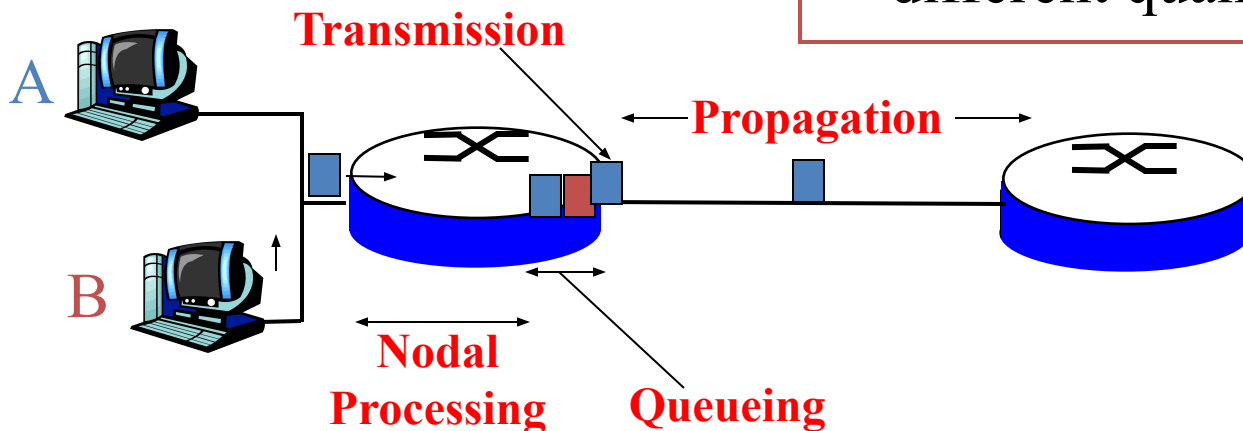

## Transmission Delay:

- $R$  = Link bandwidth (bps)
- $L$  = Packet length (bits)
- Time to send bits into link  
=  $L/R$

## Propagation Delay:

- $d$  = Length of physical link
- $s$  = propagation speed in medium ( $\sim 2 \times 10^8$  m/sec)
- propagation delay =  $d/s$

**Note:**  $s$  and  $R$  are *very* different quantities!

# Queueing delay (revisited)

- $R$  = Link bandwidth (bps)
- $L$  = Packet length (bits)
- $a$  = Average packet arrival rate

**Traffic intensity =  $La/R$**

- r*  $La/R \sim 0$ : Average queueing delay small
- r*  $La/R \rightarrow 1$ : Delays become large
- r*  $La/R > 1$ : More “work” arriving than can be serviced, average delay infinite!

# “Real” Internet Delays and Routes

**traceroute (or tracert):** Routers, round-trip delays on source-dest path

Also: pingplotter, various Windows programs

# Outline

- What is the Internet?
- Network Edge
- Network Core
- Delay, Loss, Throughput in Networks
- **Protocol Layers, Service Models**
- History

# Protocol “Layers”

## Networks are Complex!

- Many “pieces”:
  - Hosts
  - Routers
  - Links of various media
  - Applications
  - Protocols
  - Hardware, software

## Question:

Is there any hope of *organizing* structure of network?

Or at least our discussion of networks?

# Internet Protocol Stack

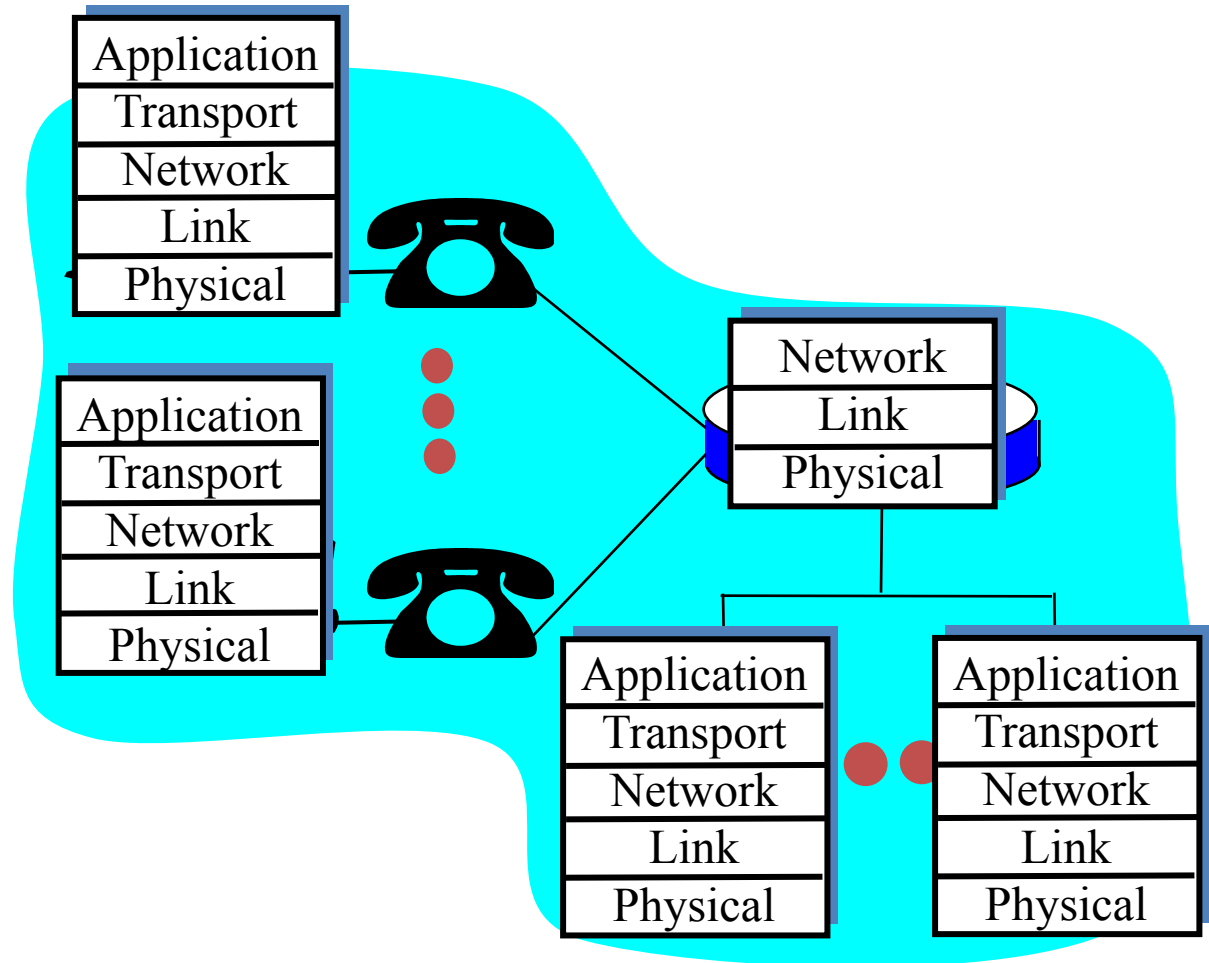

- **Application:** supporting network applications
  - FTP, SMTP, HTTP
- **Transport:** host-host data transfer
  - TCP, UDP
- **Network:** routing of datagrams from source to destination
  - IP, routing protocols
- **Link:** data transfer between neighboring network elements
  - PPP, Ethernet
- **Physical:** bits “on the wire”, “over the air”

# Layering: Logical Communication (1)

Each layer:

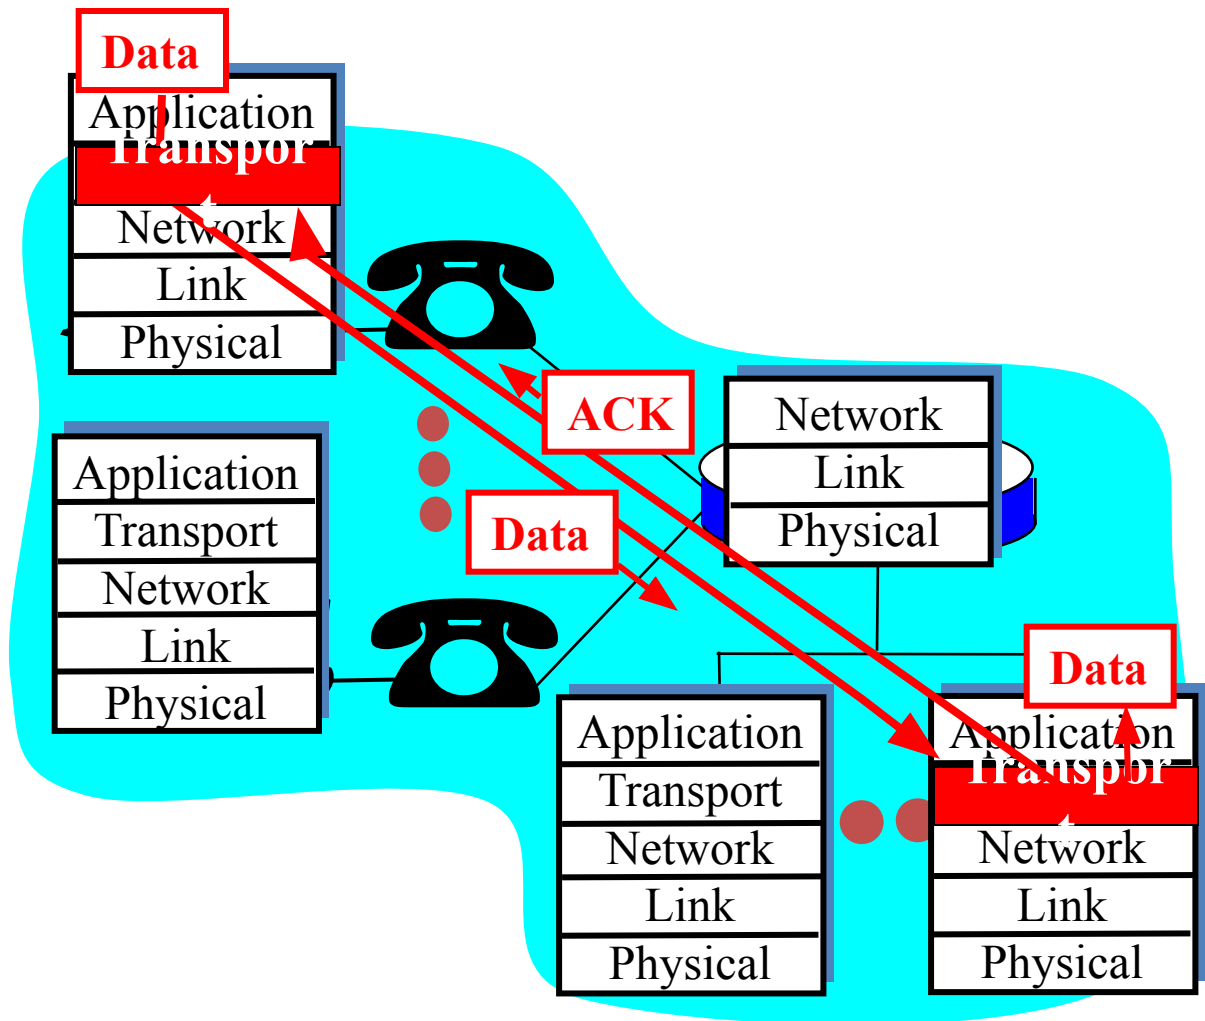

- Distributed
- “Entities” implement layer functions at each node
- Entities perform actions, exchange messages with peers

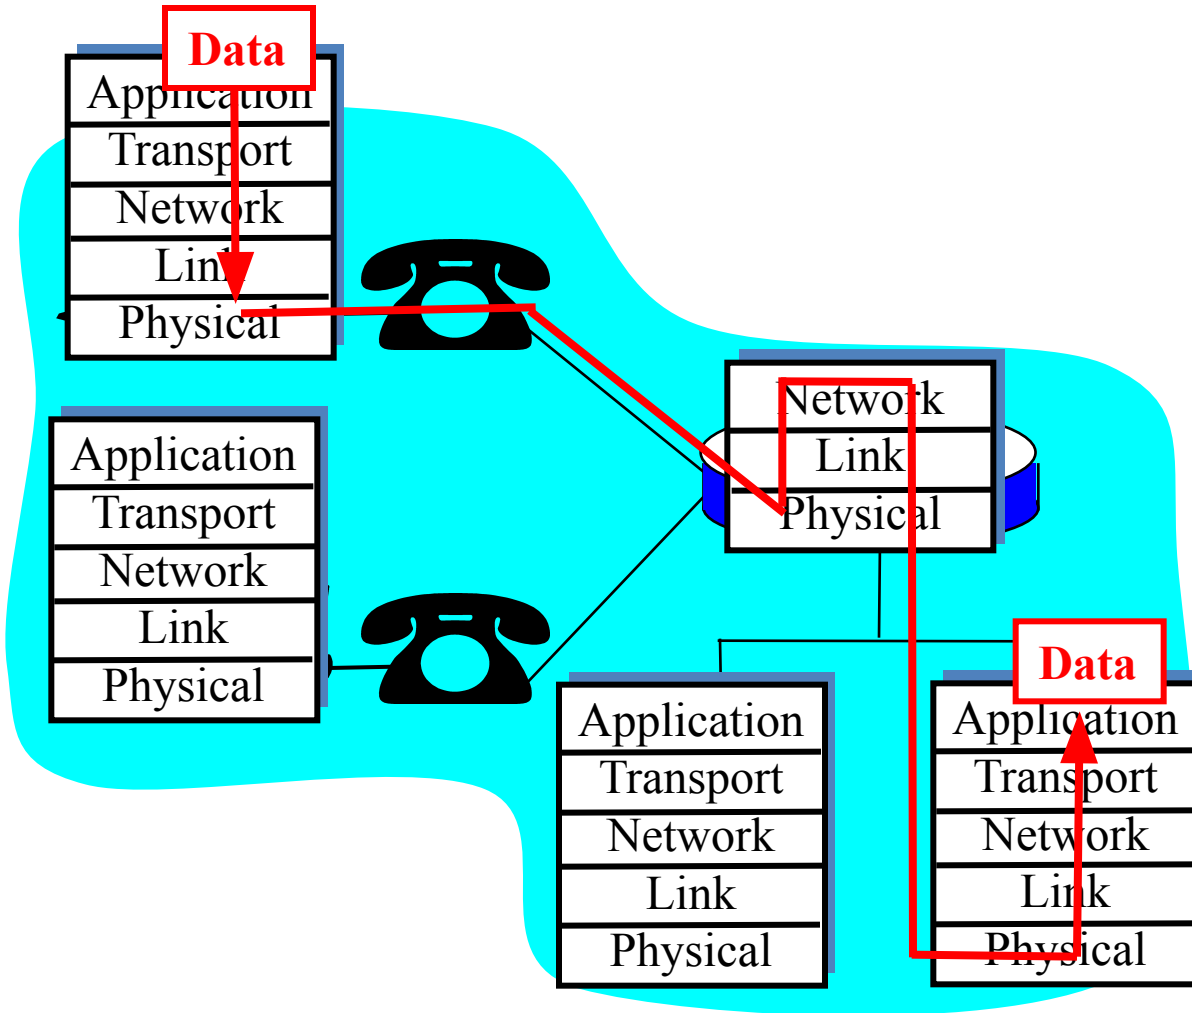

# Layering: *Logical* Communication (2)

## E.g.: Transport layer

- Take data from app
- Add addressing, reliability check info to form “datagram”
- Send datagram to peer
- Wait for peer to ack receipt
- Analogy: post office

# Layering: Physical Communication

# Protocol Layering and Data

Each layer takes data from above

- Adds header information to create new data unit
- Passes new data unit to layer below

# Outline

- What is the Internet?
- Network Edge
- Network Core
- Delay, Loss, Throughput in Networks
- Protocol Layers, Service Models
- **History**

# Internet History (1)

## *1961–1972: Early packet-switching principles*

- **1961:** Kleinrock – queueing theory shows effectiveness of packet-switching
- **1964:** Baran – packet-switching in military nets
- **1967:** ARPAnet conceived by Advanced Research Projects Agency
- **1969:** First ARPAnet node operational
- **1972:**
  - ARPAnet demonstrated publicly
  - NCP (Network Control Protocol) first host-host protocol
  - First e-mail program
  - ARPAnet has 15 nodes

# Internet History (2)

## *1972–1980: Internetworking, new and proprietary nets*

- **1970:** ALOHAnet satellite network in Hawaii
- **1973:** Metcalfe's PhD thesis proposes Ethernet
- **1974:** Cerf and Kahn - architecture for interconnecting networks
- **late 70s:** Proprietary architectures: DECnet, SNA, XNA
- **late 70s:** Switching fixed length packets (ATM precursor)
- **1979:** ARPAnet has 200 nodes

### **Cerf and Kahn's internetworking principles:**

- Minimalism, autonomy - no internal changes required to interconnect networks
- Best effort service model
- Stateless routers
- Decentralized control

### **Define today's Internet architecture**

# Internet History (3)

## *1980–1990: New protocols, a proliferation of networks*

- **1983:** Deployment of TCP/IP
- **1982:** SMTP e-mail protocol defined
- **1983:** DNS defined for name-to-IP-address translation
- **1985:** FTP protocol defined
- **1988:** TCP congestion control
- New national networks: Csnet, BITnet, NSFnet, Minitel
- 100,000 hosts connected to confederation of networks

# Internet History (4)

## *1990s: Commercialization, the WWW*

- **Early 1990's:** ARPAnet decommissioned
- **1991:** NSF lifts restrictions on commercial use of NSFnet (decommissioned, 1995)
- **Early 1990s:** WWW
  - hypertext [Bush 1945, Nelson 1960s]
  - HTML, http: Berners-Lee
  - 1994: Mosaic, later Netscape
  - Late 1990s: commercialization of the WWW

## Late 1990's:

- Est. 50 million computers on Internet
- Est. 100 million+ users
- Backbone links running at 1 Gbps

# Introduction: Summary

## Covered a “ton” of material!

- Internet overview
- What’s a protocol?
- Network edge, core, access network
  - Packet switching versus circuit switching
- Performance: loss, delay
- Layering and service models
- Backbones, NAPs, ISPs
- History

## You now have:

- Context, overview, “feel” of networking
- More depth, detail *later* in course
