

Introduction To ArcMap

ArcMap is a Map-centric GUI tool used to perform map-based tasks

- Mapping
 - Create maps by working geographically and interactively
- Display and present
 - Export or print
 - Publish on WWW
- Edit
 - Update data
 - Modify features
- Query
- Chart
- Reporting
 - Embed maps in reports

ArcMap is a Map-centric GUI tool used to perform map-based tasks

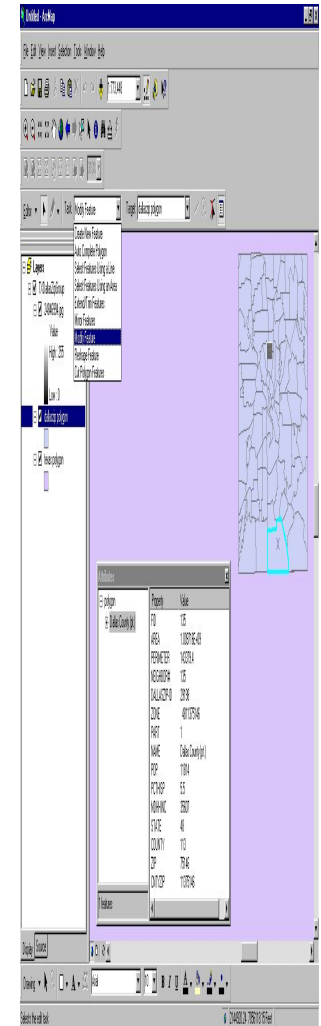

- Analyze
 - Visualize information
 - See patterns
 - Reveal hidden trends
 - Show relationships between features
 - Solve problems
 - Where is
 - How close
 - How much
 - What if
- Develop custom mapping applications based on ArcMap components

ArcMap

- Is both a data editor as well as map generator
- Provides two different ways to view a map on the fly
 - Data view
 - Layout view

Navigating Around the Map

Map Layers & Data Frames

- Arcinfo 8 maps have layers and data frames
- Data frames organize layers similar to ArcView Views
- Data frames have a map extent and a map projection
- Layers are like ArcView themes, but persistent
- Layers represent your geographic data with colors and symbols
- Layers support
 - Thematic mapping
 - Single symbol values
 - Unique value
 - Graduated color ramps
 - Proportional symbols
 - Look up tables
 - Pie and bar chart maps

Layers

- A layer defines how to display the geographic data it references.
- When you add a layer to a map, ArcMap references the data source the layer is based on.
- When a map is saved data references are stored with it.
- Maps opened in ArcMap locate data based on stored references.
- As in ArcView, if the data location has changed you will be prompted to locate the data source yourself, or ignore the reference in which case the layer will not be drawn.
- ArcMap allows storage of relative pathnames to data sources referenced on a map. This allows you to distribute you data and maps in the same directory. The reference on the map would be correct regardless of where they were placed on the disk.
- It is very easy to add layers to a map.
 - All you do is drag the layer from ArcCatalog to the data frame.

Managing Layers in ArcMap

- In ArcMap you can...
 - Change a layers's text description
 - Change a layer's drawing order
 - Copy layers
 - Remove layers from a map
 - Group layers together
 - Access layer properties
 - Display layers at different scales
 - Use data frames to organize layers
 - Save a layer to a disk
 - Repair broken data links

Labeling Map Features

- Labels are text on a map that provides additional information about a feature
 - Can label on the fly with any or several attributes
 - Advanced options for label placement and visibility
 - Labels can be made into annotation layers and stored in geodatabases with relationships to a feature class

Managing Annotation

- Annotation refers to the process of automating text placement OR to the text itself
- In addition to geometry and location, geographic features can have descriptive text associated with them, e.g., streets with names
- Annotation may also be a geographically located piece of text independent of other features, e.g., Name of mountain range on map

Geodatabase Annotation

- Annotation can be created for feature classes in the geodatabase
 - Stored in annotation classes (special feature classes) as ESRI annotation features
 - Annotation classes can be managed in **ArcCatalog** the same way as feature classes and tables
- Two kinds of annotation in a geodatabase
 - Feature-linked – annotation class is linked to another feature class in the geodatabase via relationship class
 - Relationship class is managed as any other relationship class
 - Nonfeature-linked – geographically placed text strings not associated with geodatabase feature classes
 - No relationship class linking it to a feature class

Coverage Annotation

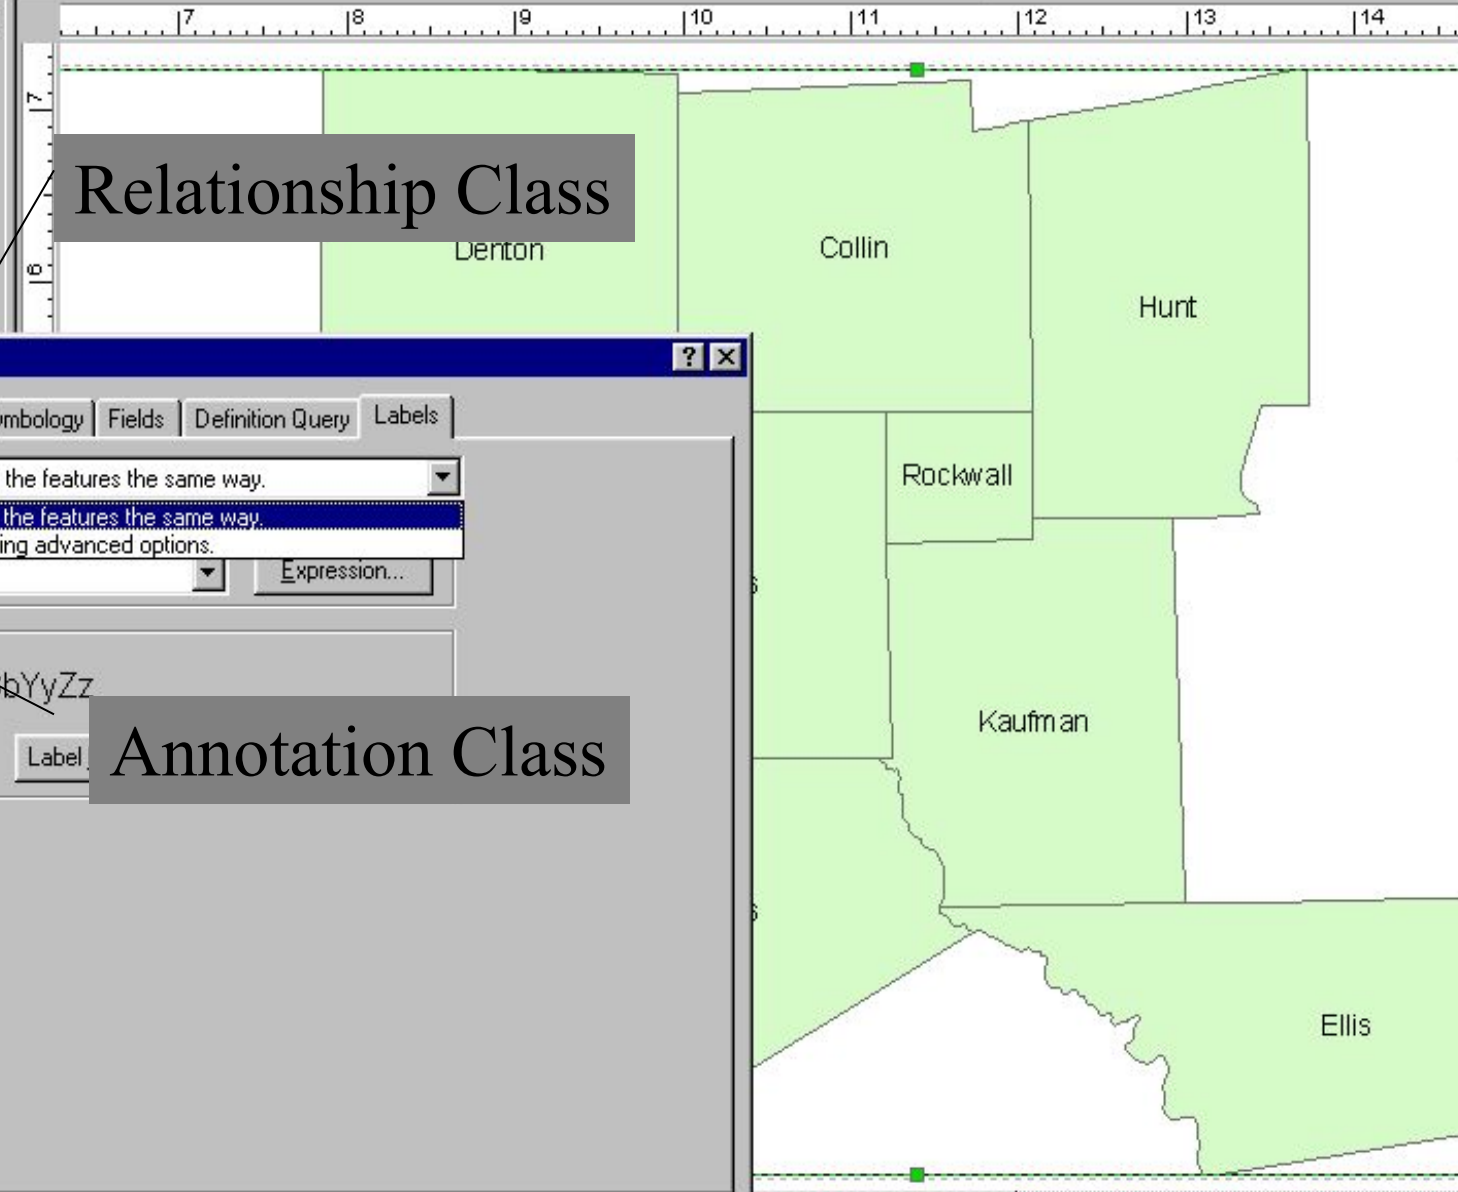

- Annotation in coverages can be converted to geodatabase annotation classes using ArcMap
- Converted coverage annotation cannot be feature-linked
 - Relationship classes can be created to link feature classes to converted coverage annotation but the behavior is different than true feature-linked annotation

ArcMap Editing

- ArcMap editor has tools to edit
 - Tables.
 - Shapefiles.
 - Coverages.
 - Geodatabases (personal & SDE).
- Direct Geodatabase editing (personal & SDE).
- Cad-like.
- Rule based.
- Long transactions.
- Un-do, re-do.
- Edit many layers at the same time.

ArcMap Editing

- All editing takes place within an edit session
- Editing sessions are started and ended from editor menu on editor toolbar
- Can edit attributes interactively from ArcMap
- Can edit multiple features in one session
- Can copy and paste individual or multiple attribute values from feature to feature

Overview & Magnification Windows

- In data view only, instead of repositioning you can open.....
 - Magnifier window.
 - Acts like magnifying glass.
 - Overview window.
 - Show full extent of the data.
- Handy for editing and finding your way about multiple layers.

ArcGIS Desktop interface showing a map of the Raleigh, North Carolina area. The map displays several layers: County (North Carolina), County Zips, Census Tracts, and Census Tracts Zips. A 'Data' window is open, displaying a table with columns for ID, Name, State, X, Y, and Shape. The table contains 26 rows of data for various census tracts.

ID	Name	State	X	Y	Shape

Working with Tables in ArcMap

- **Tables** – used in ArcMap to inspect attributes of geographic features
 - Rows are records
 - Records represent geographic features
 - Example
 - » Parcel
 - » Highway
 - » Lake
 - Columns are fields
 - Fields represent attributes of a feature
 - Example
 - » Length
 - » Depth
 - » Cost

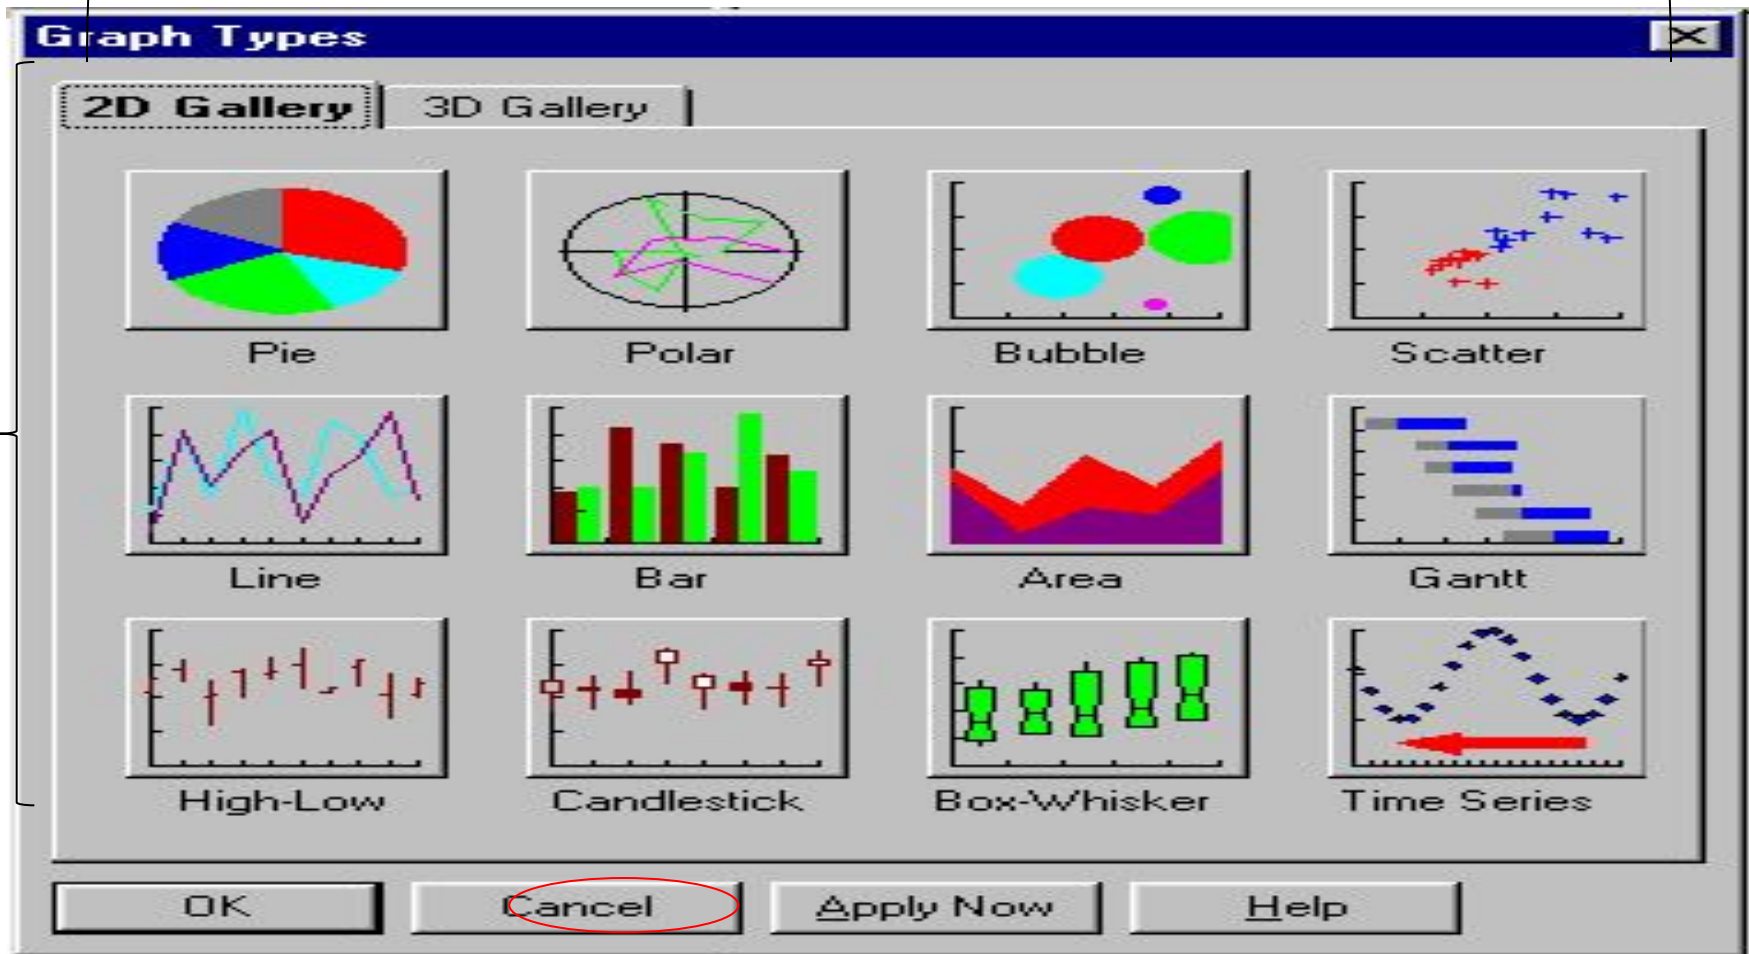

Working with Tables in ArcMap

- Add tables to maps
- Organize
 - Freeze/unfreeze columns
 - Rearrange & resize columns
- Sort records
 - Ascending & descending
 - By more than one column
- Edit
 - Add or change records & values
 - Copy and paste records & values
- Query
 - Find values using “find” tool
 - Select records interactively or by attribute with query ”wizard”
- Make simple or advanced field calculations using “field calculator” & VB scripts
- Join
 - By name or attribute (common values)
 - By location (spatial join)
- Use relationships to query information in a related table

Graphs & Reports

- Graphs & Reports
 - Present information about map features and their relationships
- Graphs
 - Present tabular data about map features in graph
 - Derived from attribute tables
 - Can include in map layouts
 - Can save, load or export as graphic file
- Reports
 - Present tabular data about map features in an attractive manner
 - Derived from attribute tables
 - Can include in map layouts
 - Can save, load, or export as PDF, RTF, or TXT

Reports

- A report presents tabular information about features on the map formatted in an attractive manner.
- Reports are derived from an attribute table on your map.
- Report can be placed on your map layout next to your geographic data or Reports can be saved as a file, e.g. *.pdf, for distribution.
- You can include a title, page numbers, the current date, summary statistics, and images.
- There are different kinds of reports you can create:
 - Record report where each record is represented by a row in the display.
 - Columnar report with data organized in a single column, displaying field names and columns vertically.
