

Marble in construction and interior design

In the history of the development of the construction industry, marble justifiably occupies a place of honor.

In Russia, marble began to be used in the construction of palaces and temples, decoration of pavements and fountains during the time of the tsar, in the Soviet period, this unique natural stone was used in the decoration of mausoleums, monuments, monuments and government institutions.

In modern architecture, marble is again gaining the position of an elite and noble finishing material.

Today, marble is quite actively used in the manufacture of stairs and railings, window sills, tiles for bathrooms, kitchen countertops, plumbing and decor items, be it flowerpots, figurines, or elegant dressing tables.

Along with natural marble in its original form, marble chips, sand, plaster and crushed stone from marble are widely used in the construction industry. These materials are obtained by crushing stone into various fractions.

Natural stone, practical and incredibly beautiful, cold and exactingly austere - marble has not ceased to be a noble building material for centuries.
