# “Unique” fold?

Dimerization involves an isomerization of the  $\beta$ -sheet. Structurally equivalent residues are few and contribute either to the Ltn10 core (red) or to the dimeric interface of Ltn40 (cyan). Other nonpolar residues (orange) change sides, such that the formation of the dimeric interface on one side of the  $\beta$ -sheet destroys the hydrophobic core on the other side and vice versa.

# PREDICTION FROM PHYSICS (OR PROTEIN STATISTICS)

## 2<sup>o</sup> STRUCTURES

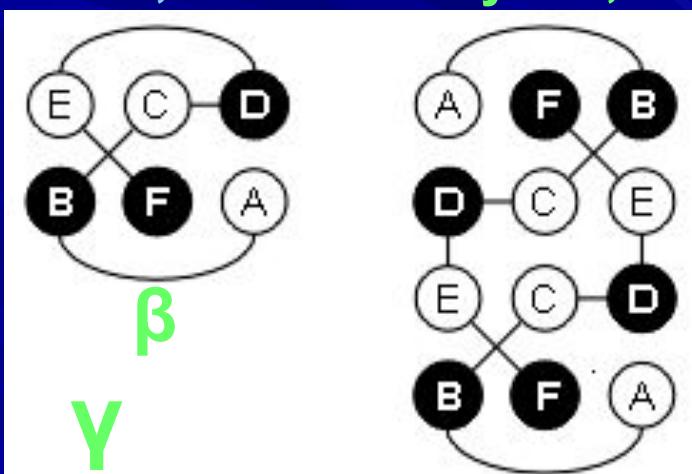

USUALLY, THIS WORKS WELL, BUT...

**Prediction, 1985**

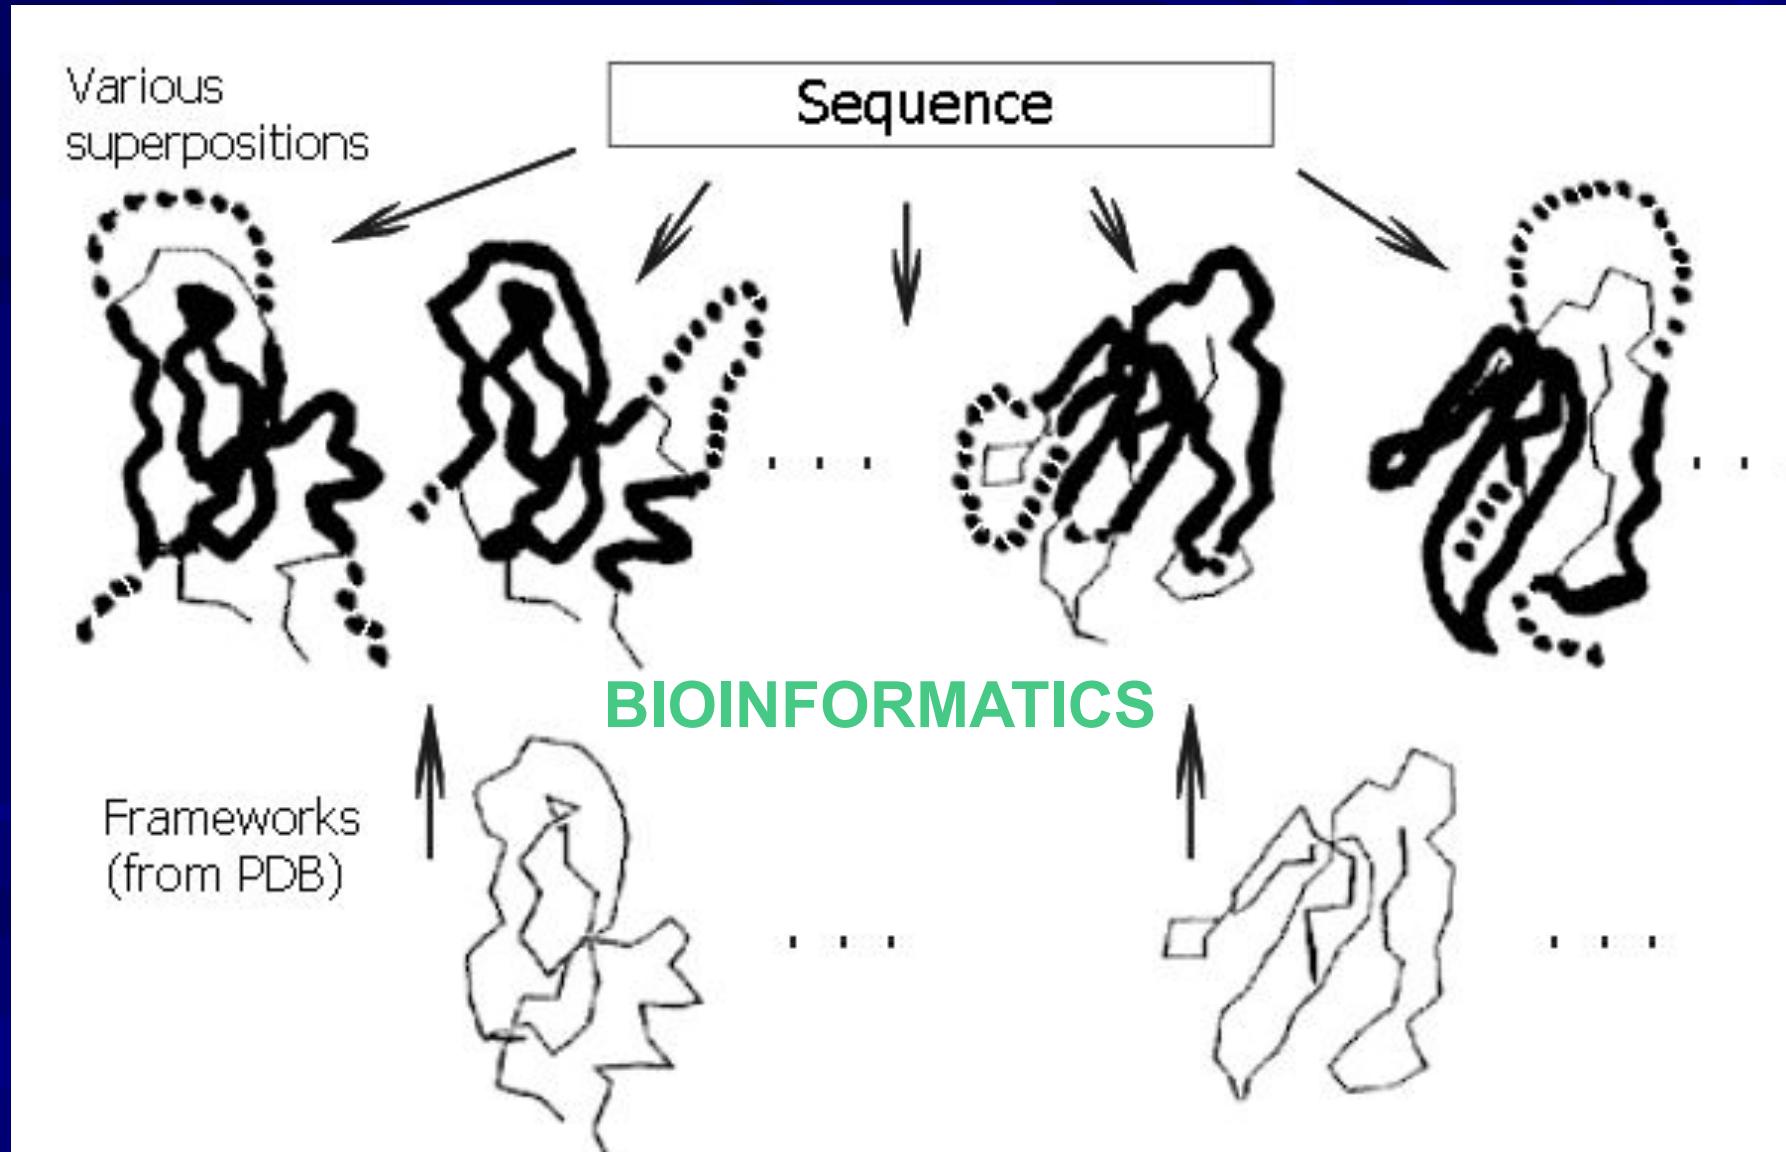

**X-ray str., 1990**

# THREADING

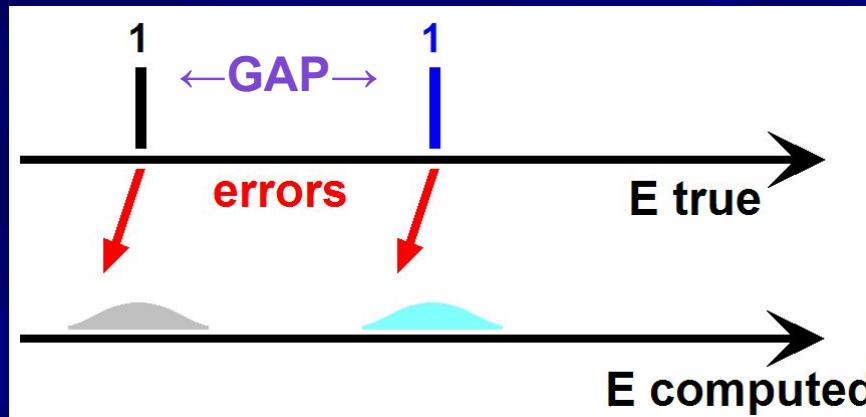

## helps, when sequence identity is low (<10-20%)

Finkelstein, Reva, 1990-91 (*Nature*); Bowie, Lüthy, Eisenberg, 1991 (*Science*)

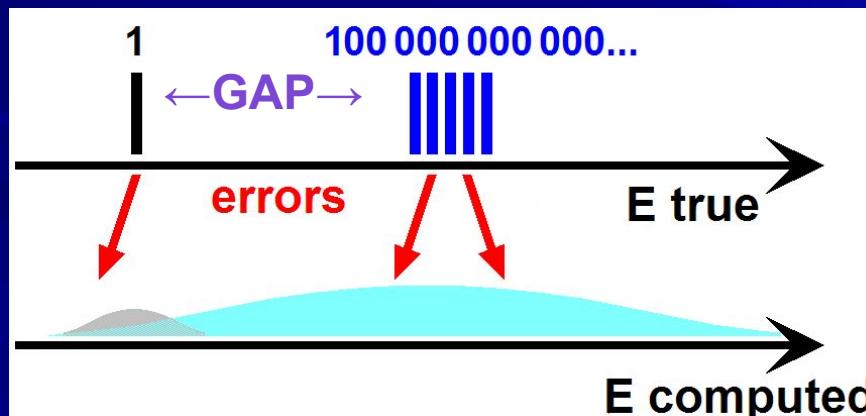

... but one still cannot reliably predict 3D protein structure from the a. a. sequence without homologues... **WHY??**

choice of one structure out of two:  
**DOES NOT** require too precise estimate of interactions

choice of one structure out of zillions:  
**REQUIRES** very precise estimate of interactions
