My Working Holiday In California - 2013

Don't Stop Believin

CyberLink PowerDirector is a digital video editing program for creating professional-looking movies and slideshows that you can send to friends, burn to discs, or upload to servers on the Internet. PowerDirector provides three editing modes for your multimedia: a full-featured editor, a simplified editor and a tool for creating slideshows.

This menu offers three methods for creating multimedia files.
Full editor - is intended for full access to all the functionality of capturing, editing and recording multimedia.
Simple editor - it is used for simple, accelerated creation of video and work with multimedia.
Tool for creating slideshows - serves to create demonstrations of photographic slides.

Begin, since it is more convenient for you.
In the main menu of the program, you can determine how you want to create your video.
If you have already edited the video, then you use a full editor with all the functions that can handle 100 tracks and controls key frames.
But if you are new to video editing or do not have enough time for detailed video design, a simplified editor with its Magic Movie tools is just the best solution for you! Just select the video and photos that you want to use, select the template and PowerDirector will do the rest for you.
Click Full Editor in the main menu of CyberLink PowerDirector.
PowerDirector displays the editing window.

Добро пожаловать в
