# LECTURES

- 1 The role of ICTs in key sectors of society. ICT Standards.
- 2 Introduction into computer systems. Architecture of computer systems.
- 3 Software. OS.
- 4 Human-computer interaction.
- 5 Database systems.
- 6 Data analysis. Data management.
- 7 **Networks and Telecommunications.**
- 8 Cyber safety.
- 9 Internet technologies.
- 10 Cloud and Mobile technologies.
- 11 Multimedia technologies
- 12 Smart technology.
- 13 E-technology. E-business. E-learning. E-government.
- 14 Information technology in the professional sphere. Industrial ICT.
- 15 ICT Development Prospects

# LECTURE 7

## **In general in this lecture you will learn about:**

- ❖ **End devices, communication devices and communication media.**
- ❖ **Network types.**
- ❖ **LANs and WANs.**
- ❖ **Wired and wireless networking technologies.**
- ❖ **Stack protocols: TCP / IP, OSI.**
- ❖ **MAC addressing. IP-addressing.**
- ❖ **The DHCP protocol.**
- ❖ **Connectivity technology to the Internet.**
- ❖ **Telecommunication technologies.**

# What is a Network?

**A network** is two or more computers, or other electronic devices, connected together so that they can exchange data.

For example a network allows computers to share files, users to message each other, a whole room of computers to share a single printer, etc.

# What is a Network?

## What does Computer Network mean?

- ▶ A computer network is a group of computer systems and other computing hardware devices that are linked together through communication channels to facilitate communication and resource-sharing among a wide range of users.

# Computers in a Network

Computers connected together to create a network fall into two categories: **servers** and **clients** (workstations).

## Clients

Client computers, or **workstations**, are the **normal computers** that people sit at to get their **work** done.

## Servers

Servers are special, powerful computers that provide '**services**' to the **client** computers on the network.

# **Networks and Telecommunications.**

**End devices, communication devices  
and communication media.**

# Networking Hardware

## Network Interface Card (NIC)

Any computer that is to be connected to a network, needs to have a network interface card (NIC).

## Network Cable

To connect together different devices to make up a network, you need cables.

# Networking Hardware

## Hub

A hub is a device that **connects** a number of computers together to make a **LAN**.

## Switch

A switch, like a hub, is a device that **connects** a number of computers together to make a **LAN**.

# Router

A router is a network device that **connects together two or more networks.**

# Bridge

A bridge is a network device that typically **links together two different parts of a LAN.**

Whereas a router is usually used to link a LAN to a WAN (such as the Internet), a bridge links independent parts of a LAN so that they act as a single LAN.

# Proxy Server

A proxy server is a computer setup to **share a resource**, usually an **Internet connection**.

# Firewall

A firewall is a **device**, or a piece of **software** that is placed between your computer and the rest of the network (where the hackers are!)

# Modem

Before the days of broadband Internet connections, most computers connected to the Internet via **telephone lines (dial-up connections)**.

# Network Cabling

- Unshielded Twisted Pair (UTP) Cable

- Shielded Twisted Pair (STP) Cable

- Coaxial Cable

- Coaxial Cable Connectors

- Fiber Optic Cable

- Wireless LANs

# Cable – Twisted Pair

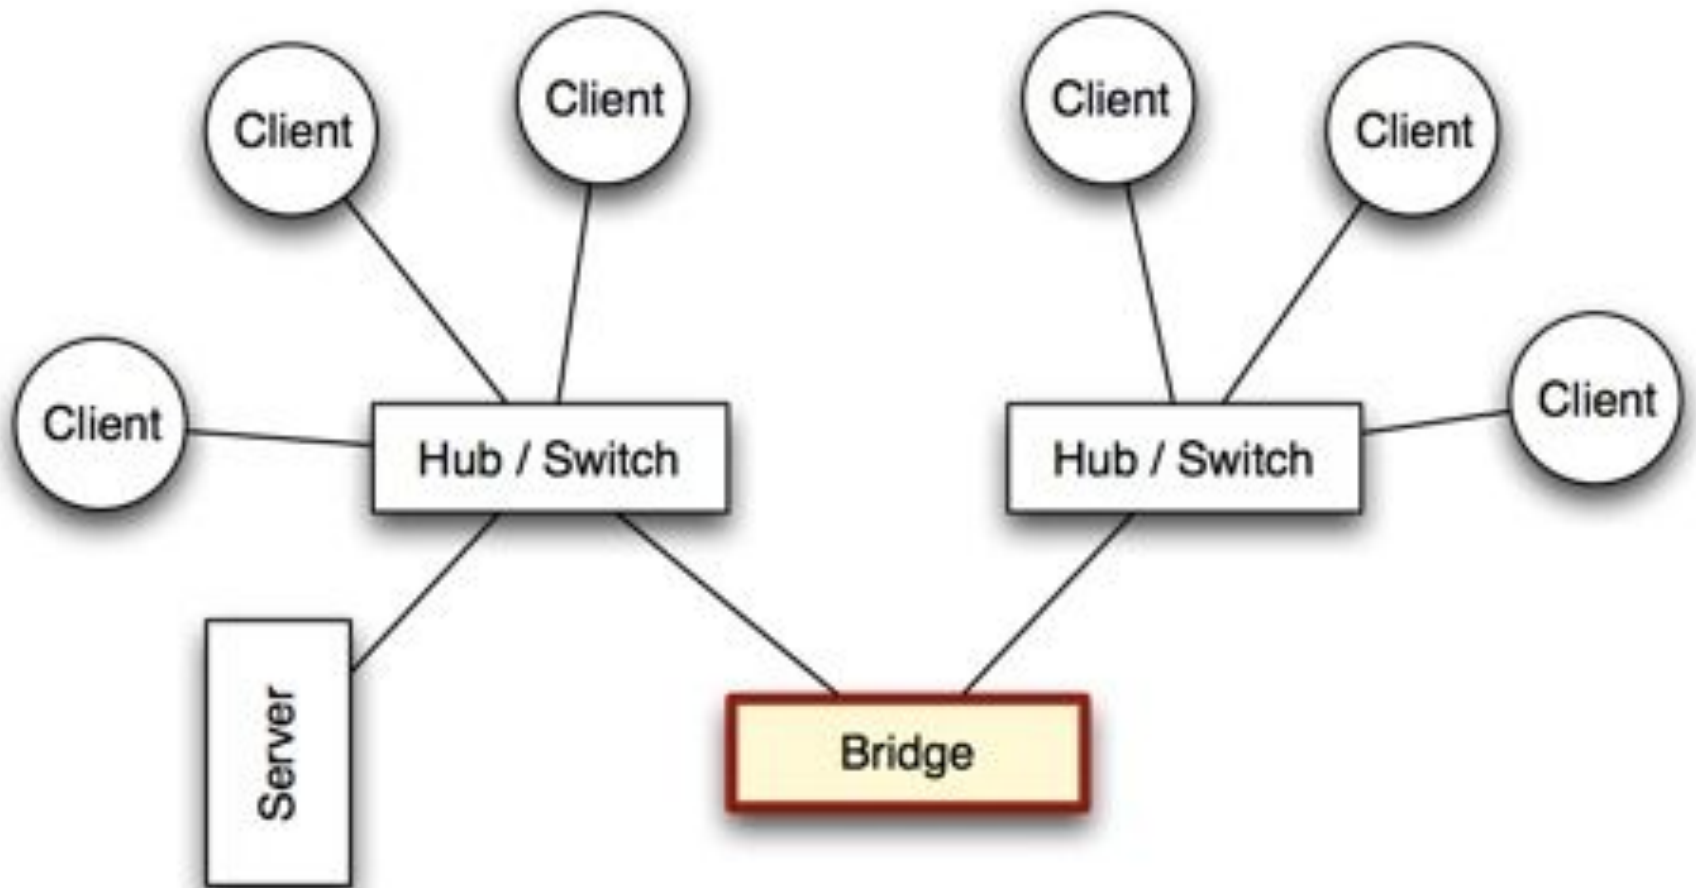

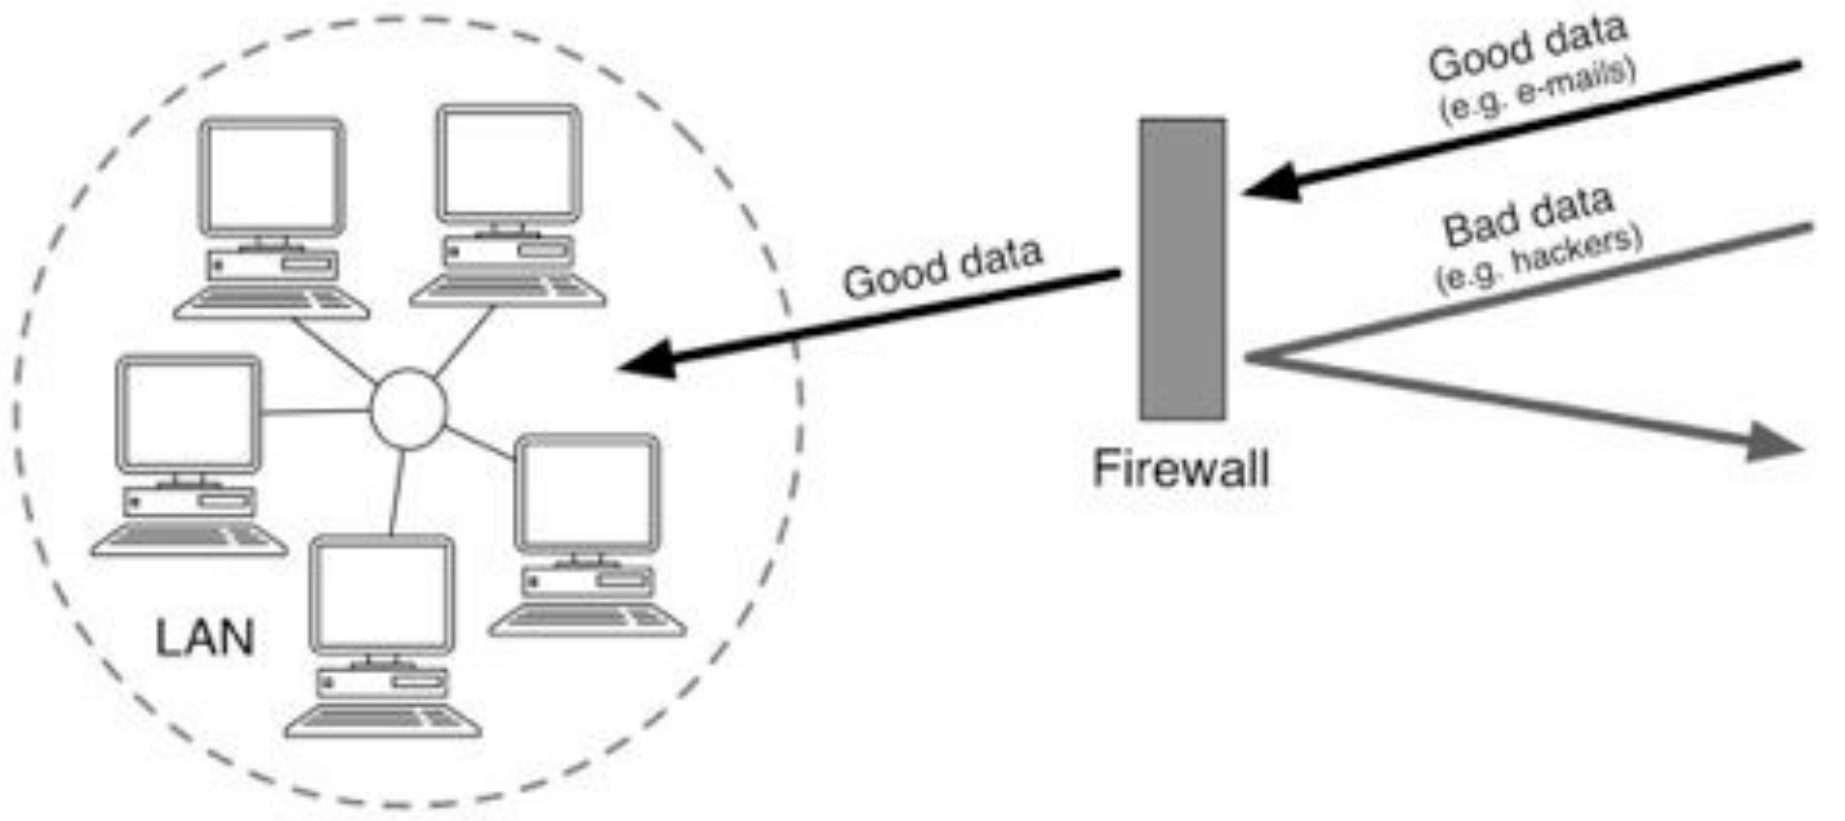

**Internet**

**Firewall**

**Home Network**

# **Networks and Telecommunications.**

**Wired and wireless networking technologies.**

# Network connections

Network connections between computers are typically created using cables (**wires**).

However, connections can be created using radio signals (**wireless / wi-fi**), telephone lines (and modems) or even, for very long distances, via satellite links.

# Network topology

- A *topology* is a way of “laying out” the network. Topologies can be either physical or logical.
- *Physical topologies* describe how the cables are run.
- *Logical topologies* describe how the network messages travel

# Two Types of LAN Topologies

**Physical topology** is the physical layout of the components on the network.

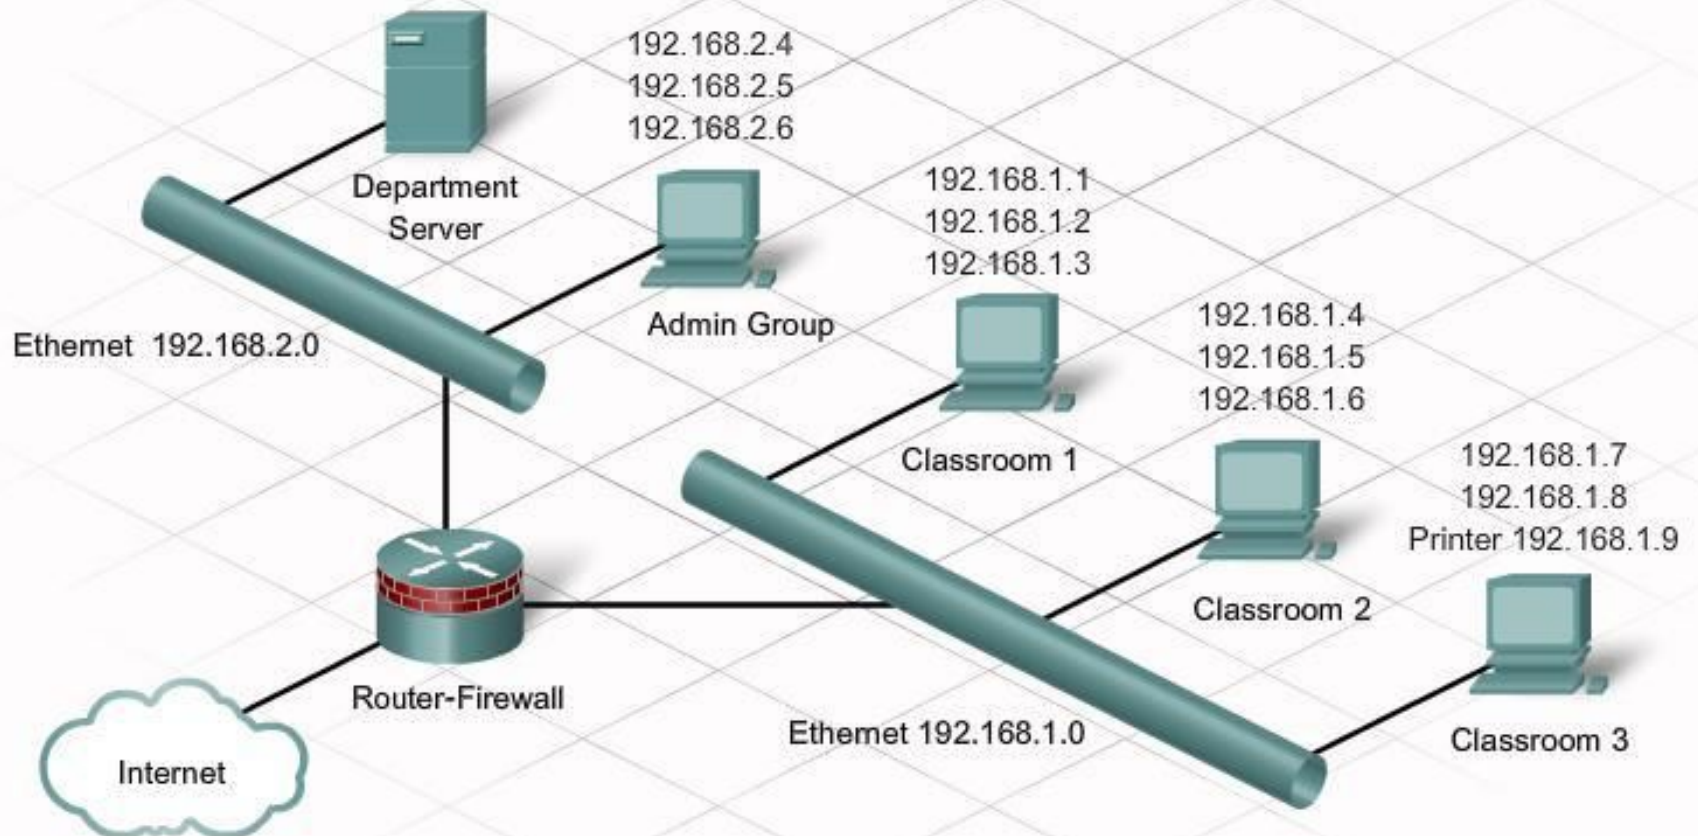

**Logical topology** determines how the hosts access the medium to communicate across the network.

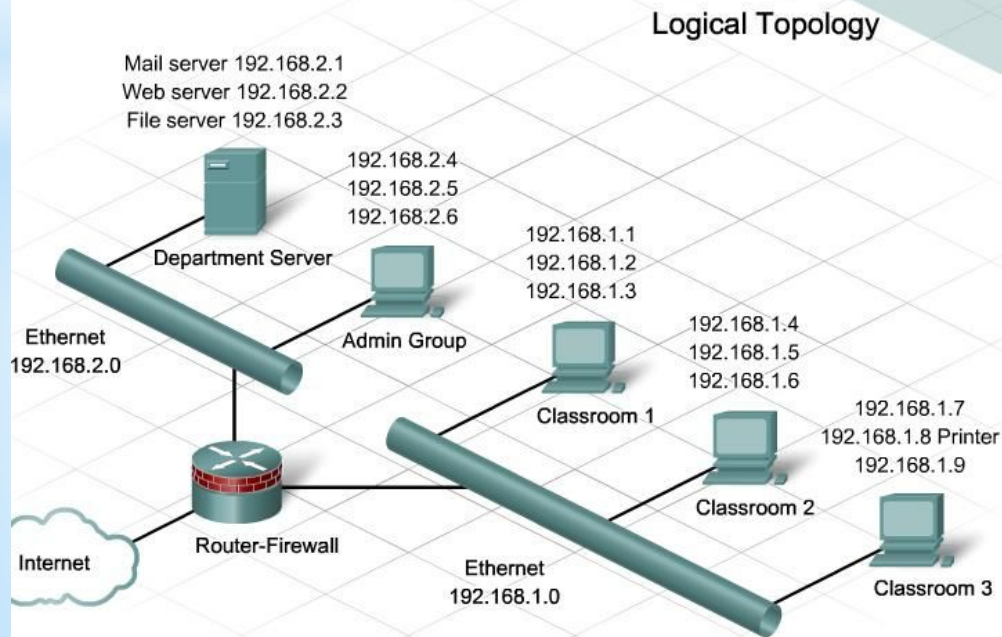

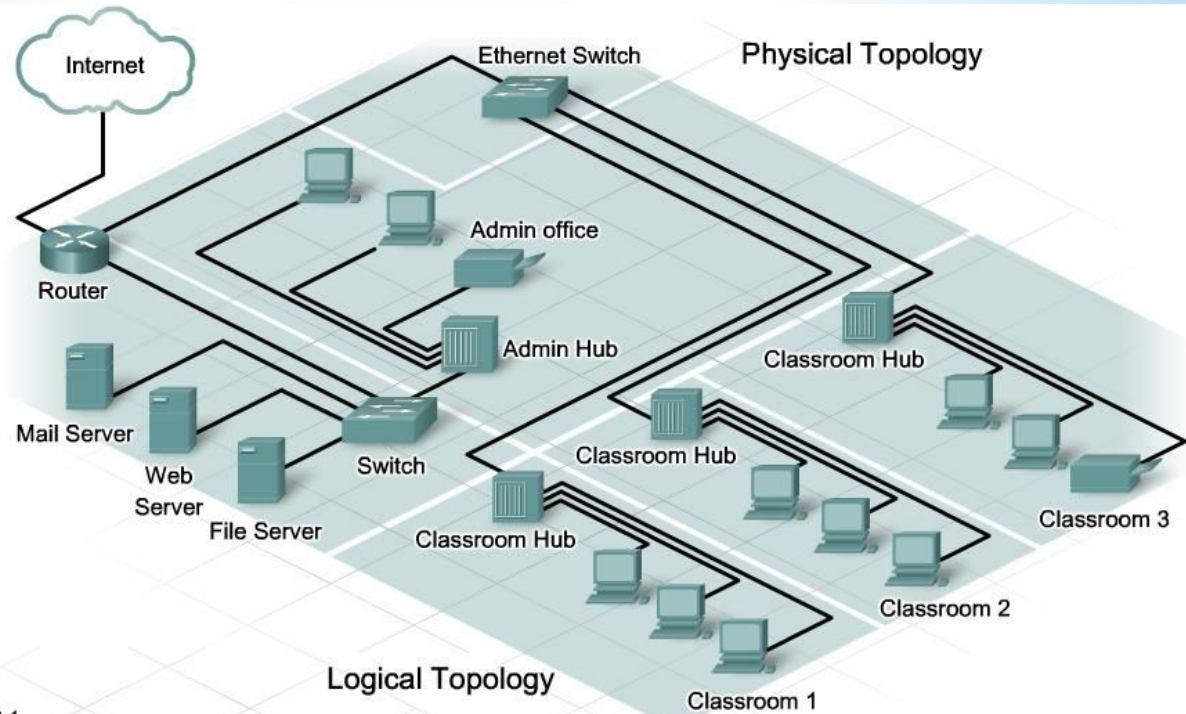

## Logical Topology

Mail server 192.168.2.1  
Web server 192.168.2.2  
File server 192.168.2.3

Bus  
Topology

Hierarchical  
Topology

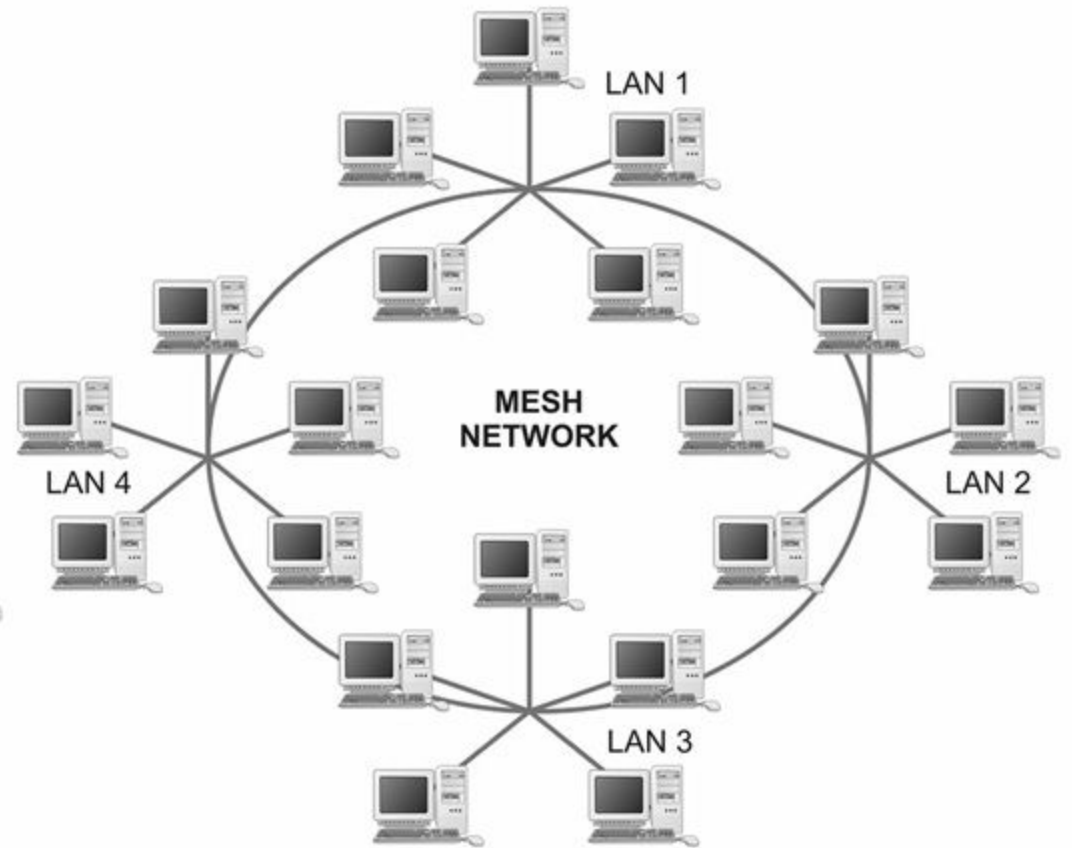

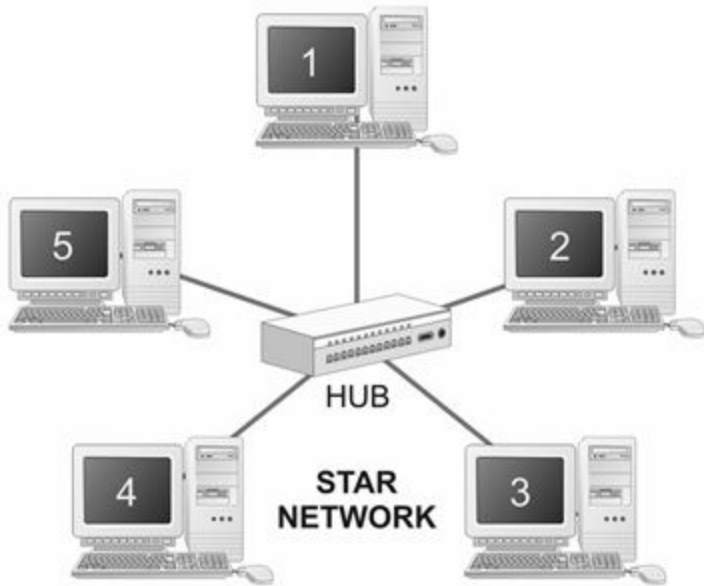

Star  
Topology

Mesh  
Topology

# Network topology (cont.)

- Advantages and Disadvantages of Network Topologies

Topology	Advantages	Disadvantages
Bus	Cheap. Easy to install.	Difficult to reconfigure. Break in bus disables entire network.
Star	Cheap. Easy to install. Easy to reconfigure. Fault tolerant.	More expensive than bus.
Ring	Efficient. Easy to install.	Reconfiguration difficult. Very expensive.
Mesh	Simplest. Most fault tolerant.	Reconfiguration extremely difficult. Extremely expensive. Very complex.

# **Networks and Telecommunications.**

**Network types**

**LANs and WANs.**

## Local Area Network (LAN)

A Local Area Network is a network confined to **one building or site**.

Often a LAN is a **private network** belonging to an organization or business.

## Wireless Local Area Network (WLAN)

A wireless LAN (WLAN) is a LAN that uses **radio signals (WiFi)** to connect computers instead of cables.

## Wide Area Network (WAN)

A Wide Area Network is a network that extends over a **large area**.

A WAN is often created by joining several LANs together, such as when a business that has offices in different countries links the office LANs together.

# There are different types of network:

- LAN(Local Area Networking)
- WLAN(Wireless Local Area Networks)
- WAN(Wide Area Networks)
- MAN(Metropolitan Area Networks)
- CAN(Campus Area Networks)

WAN

Metropolitan Area Network (MAN)

MAN

CAN

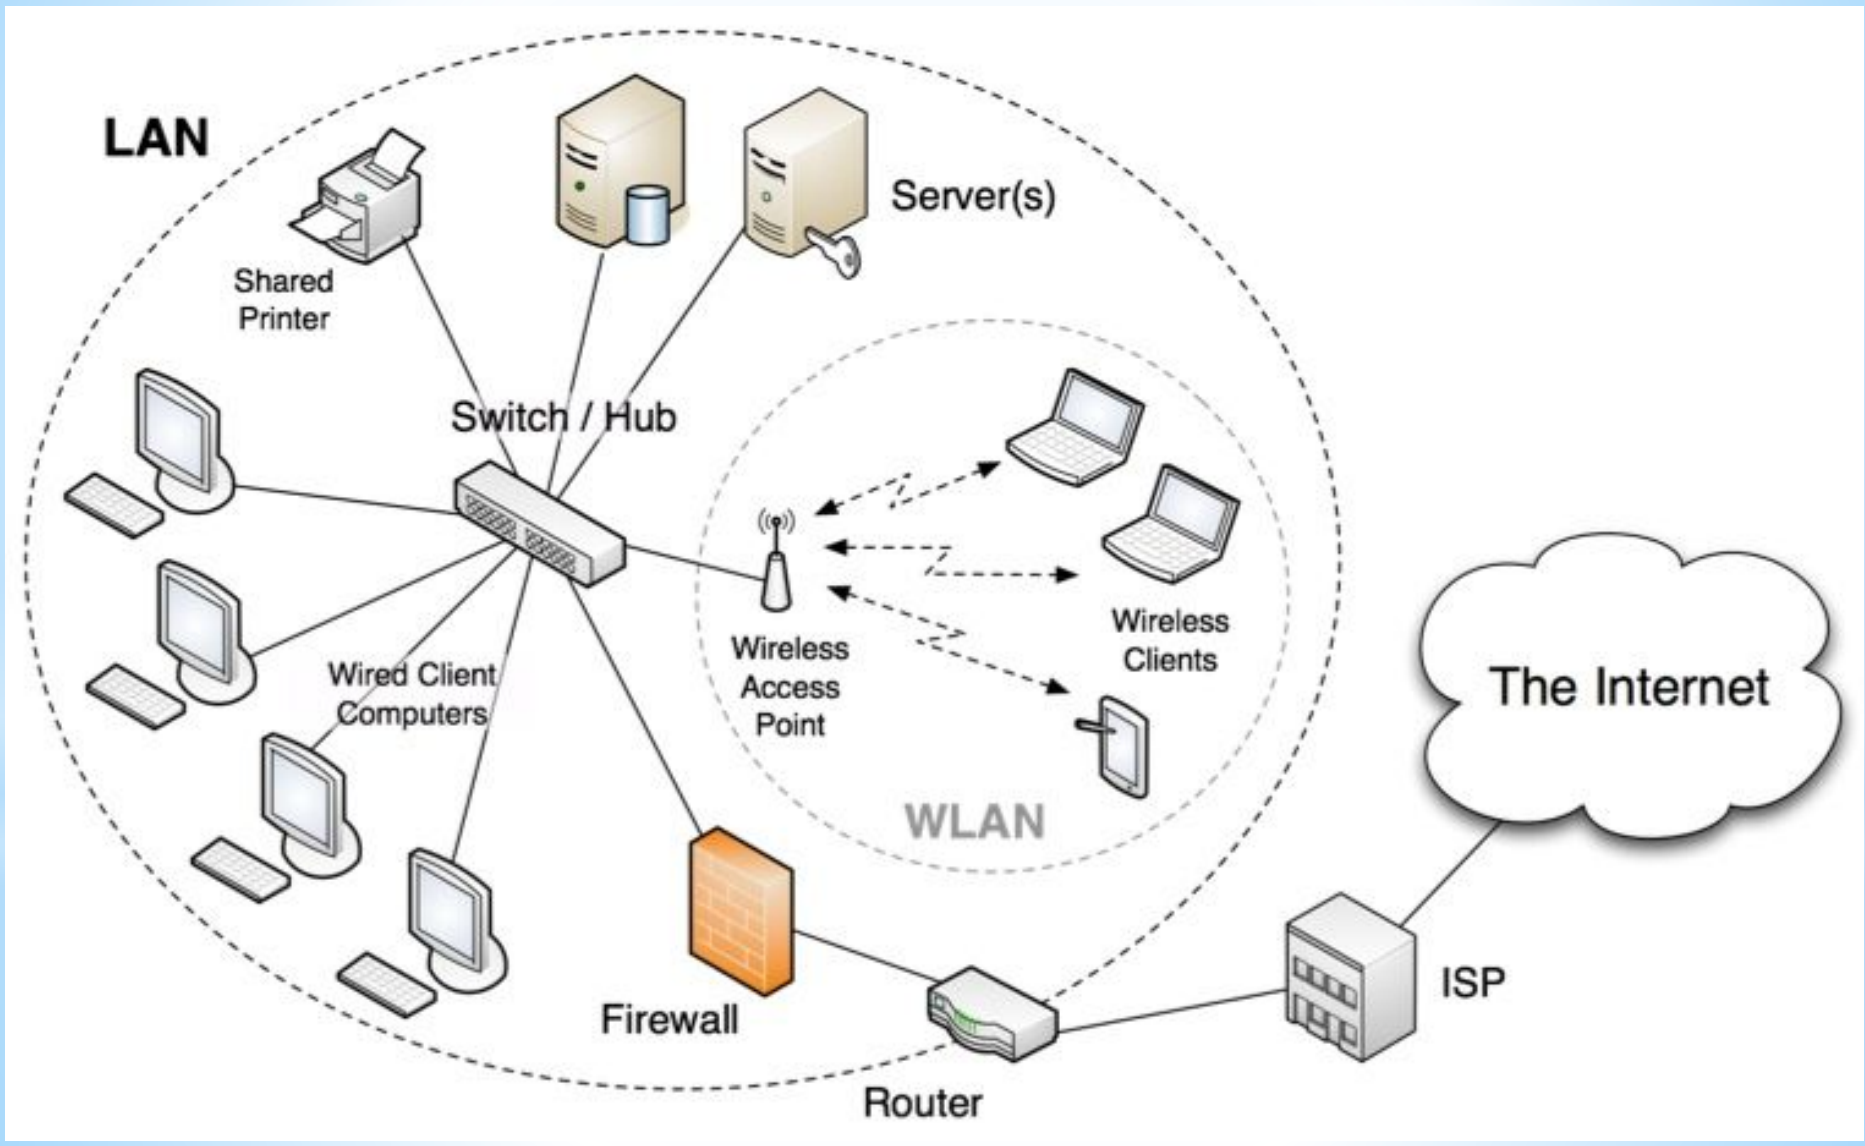

# Types of network

- ▶ Local area network (LAN) : connects computers and devices in a limited geographical area such as a home, school or office building
- ▶ wide area network (WAN) : covers a large geographic area such as a city, country, or spans
- ▶ Metropolitan area network (MAN) : is a large computer network that usually spans a city or a large campus

# Types of network

# Wide Area Network (WAN) Typical Schematic

# Networks and Telecommunications.

**Stack protocols: TCP / IP, OSI.**

**IP-addressing.**

**The DHCP protocol.**

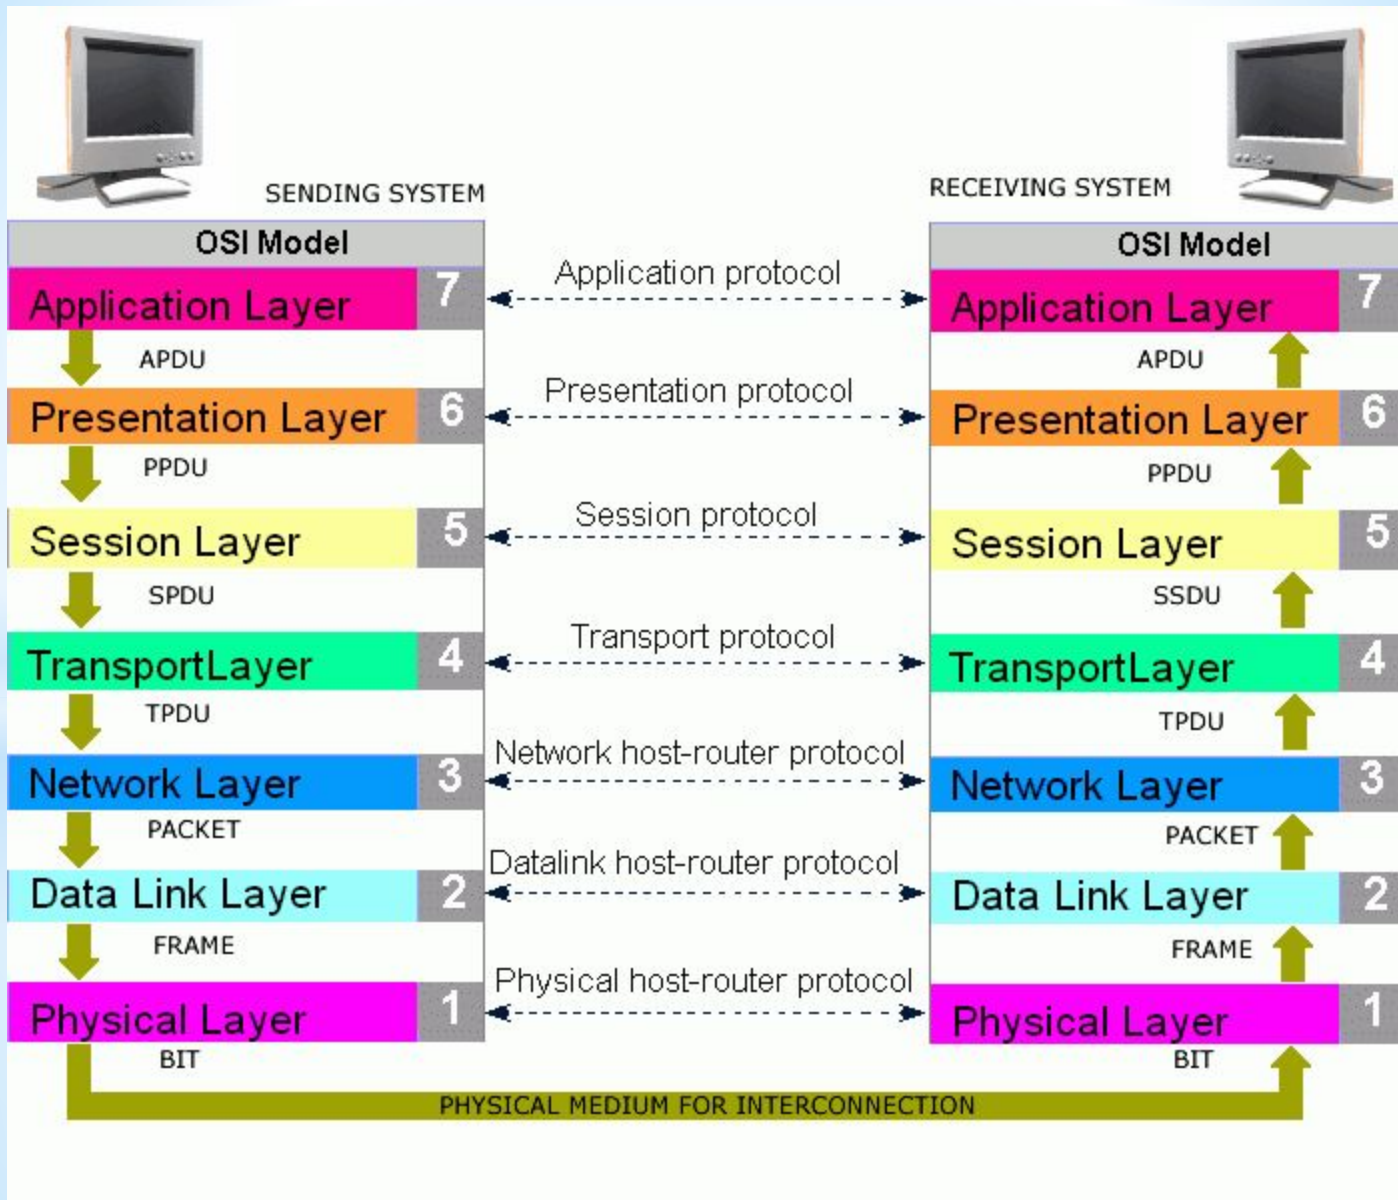

# What is the OSI model ?

- **Open Systems Interconnection** model is fundamental to all communications between network devices.
- Developed in 1974 by ISO after the American Department of Defence began using the TCP/IP suite of protocols.
- Finally adopted in 1977. It is now the theoretical model for how communication takes place between network devices.

# What is OSI Model

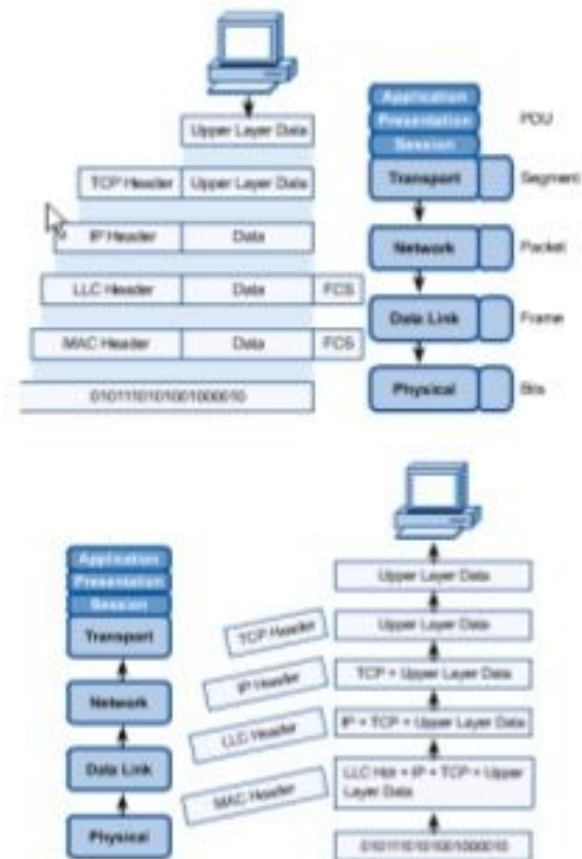

Data	Application	FTP, HTTP, SMTP Data Generation	
Data	Presentation	Jpeg, Mpeg, Gif Encryption & Formatting	
Data	Session	Apple talk Establish Connection	
Segments	Transport	TCP, UDP Delivery & Sequence	
Packets	Network	IP, IPX, ICMP Routing to Destination	Router
Frame	Data Link	PPP, Ethernet Local Network	Switch, Bridge
Bits	Physical	Ethernet, USB Access Media	Hub, Repeater

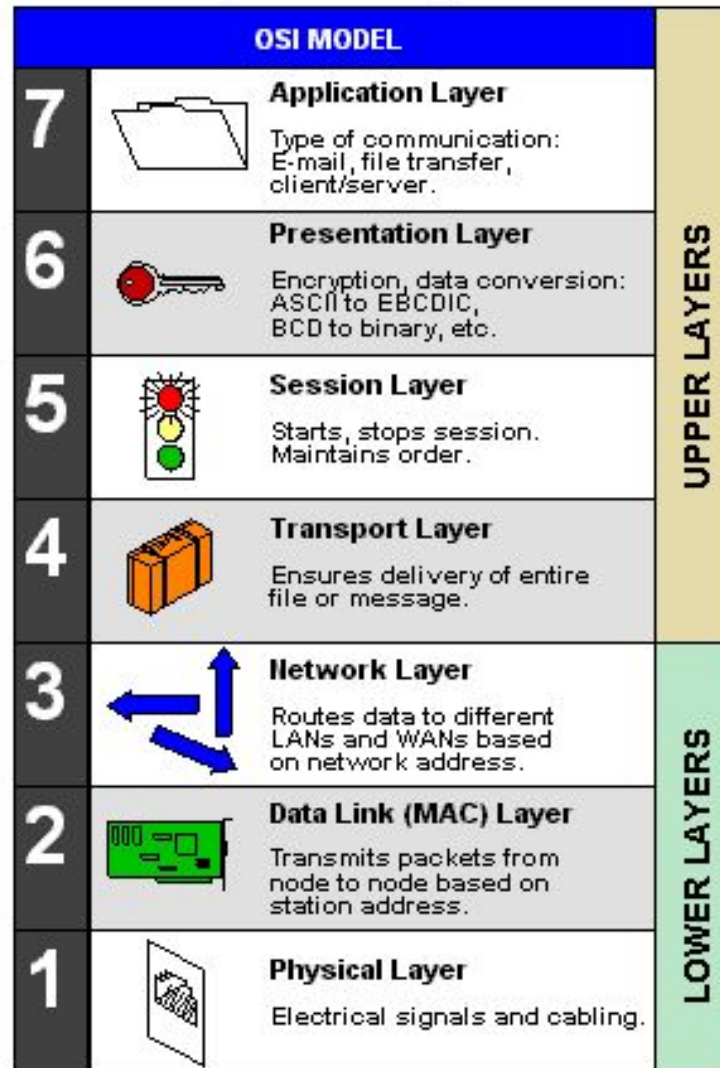

# OSI in Action

- A message begins at the top application layer and moves down the OSI layers to the bottom physical layer.
- As the message descends, each successive OSI model layer adds a header to it.
- A header is layer-specific information that basically explains what functions the layer carried out.
- Conversely, at the receiving end, headers are striped from the message as it travels up the corresponding layers.

UPPER LAYERS

LOWER LAYERS

## OSI Model

	Data unit	Layer	Function
<b>Host layers</b>	Data	7. Application	Network process to application
		6. Presentation	Data representation, encryption and decryption, convert machine dependent data to machine independent data
		5. Session	Interhost communication, managing sessions between applications
	Segments	4. Transport	Reliable delivery of segments between points on a network.
<b>Media layers</b>	Packet/Datagram	3. Network	Addressing, routing and (not necessarily reliable) delivery of datagrams between points on a network.
	Bit/Frame	2. Data link	A reliable direct point-to-point data connection.
	Bit	1. Physical	A (not necessarily reliable) direct point-to-point data connection.

# Ip address

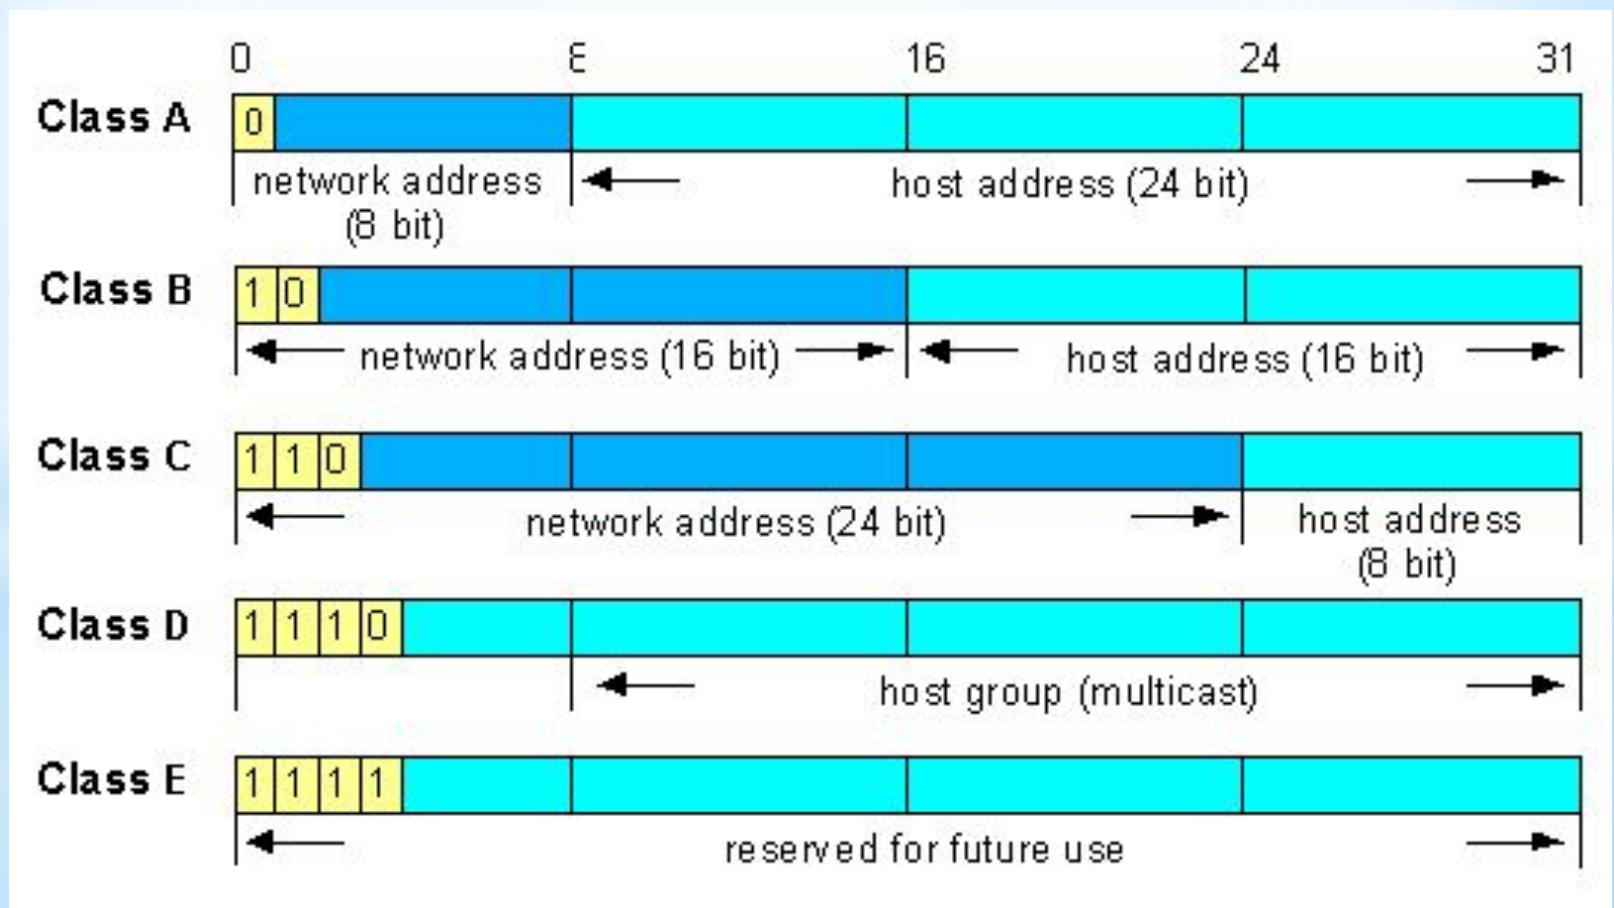

The address granted to computers is divided into two categories

**Dynamic ip addresses:** Dynamic ip address are assigned to the devices that require temporary connectivity to the network

Dhcp protocol used to assigning ip address to computer on lease time basis

**Static ip address:** Static ip address are assign to devices on the network whose existence in the network remains a longer duration

Network address	1st octet							2nd octet							3rd octet							4th octet														
	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7				
Class A	0	Network address							Computer address																											
Class B	1	0	Network address														Computer address																			
Class C	1	1	0	Network address																						Computer address										
Class D	1	1	1	0	Multicast address																															
Class E	1	1	1	1	Undefined format																															

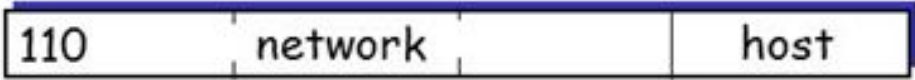

# IP Addresses

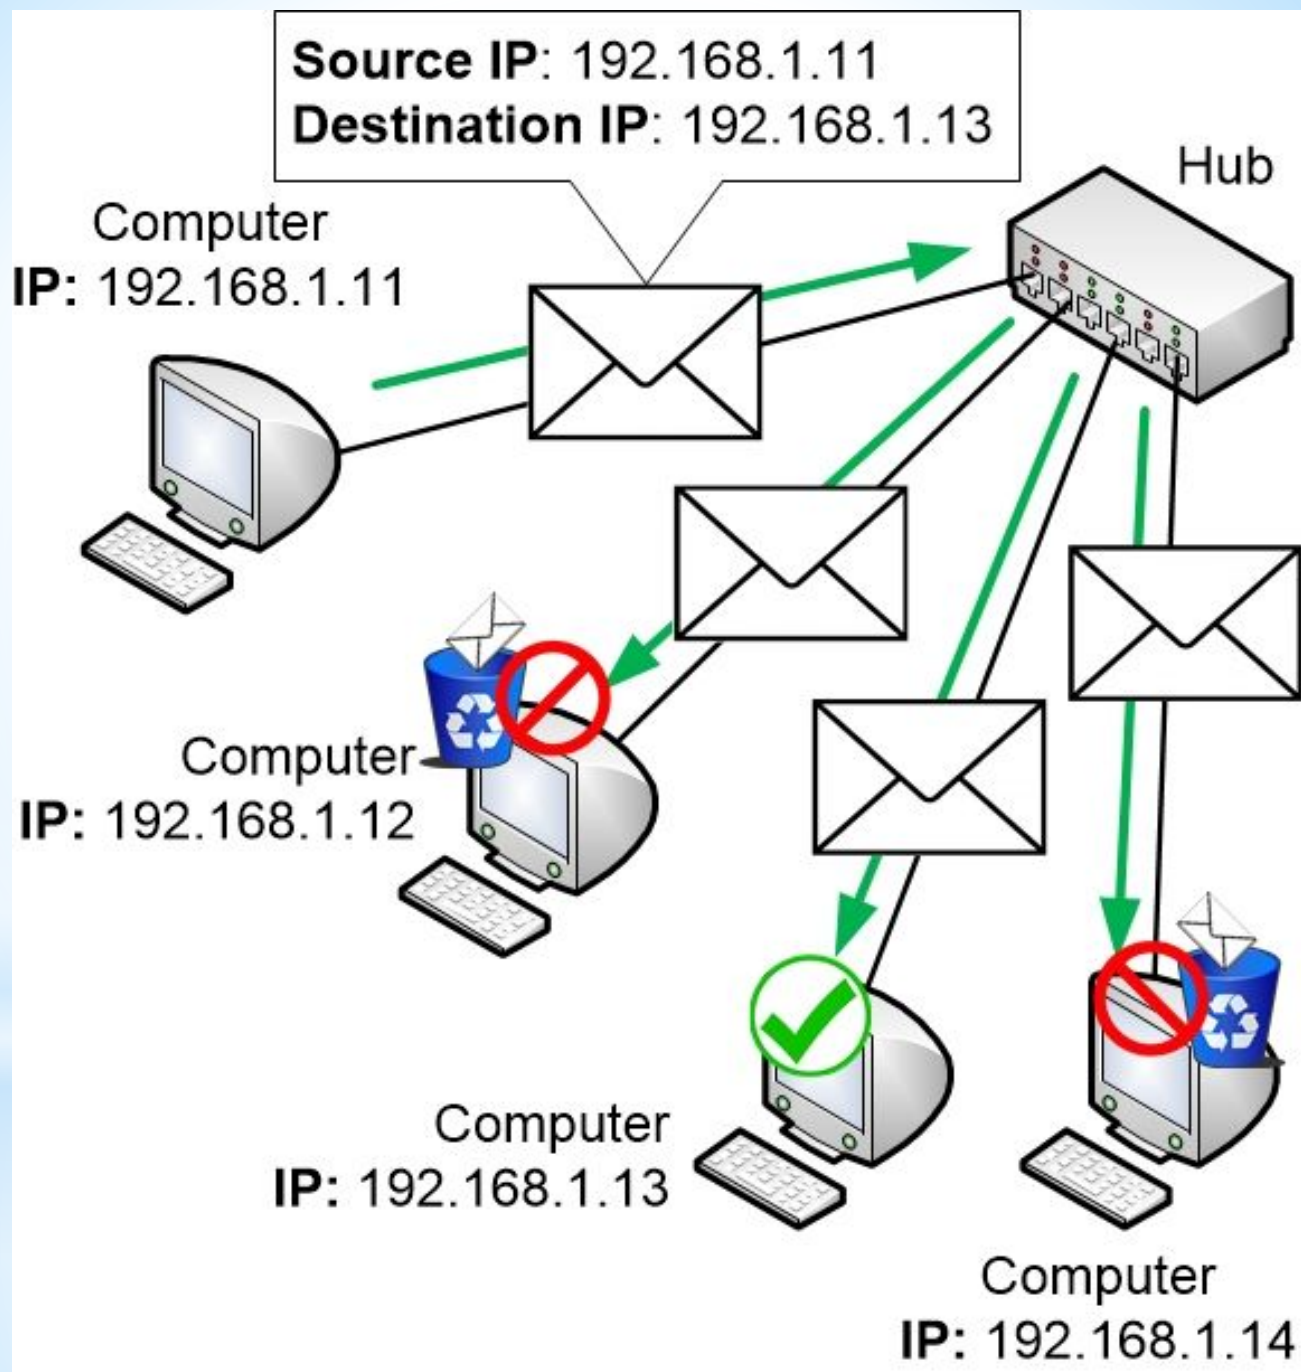

given notion of “network”, let’s re-examine IP addresses:

“class-full” addressing: 4 shown, 5<sup>th</sup> was for future use beginning with 11110

class

A		1.0.0.0 to 127.255.255.255
B		128.0.0.0 to 191.255.255.255
C		192.0.0.0 to 223.255.255.255
D		224.0.0.0 to 239.255.255.255

← 32 bits →

## Internet Protocol (IP) and Media Access Control (MAC)

Each device on the internet is given a unique address known as its **internet protocol (IP) address**. This is a 32-bit number that is usually written in the form: **109.108.158.1**

**MAC address** is unique number that identifies a device connected to the internet.

### Differences between IP addresses and MAC addresses

The IP address gives the *location* of a device on the internet, whereas the MAC address *identifies* the device connected to the internet.

**IP-address: 198.162.10.3**

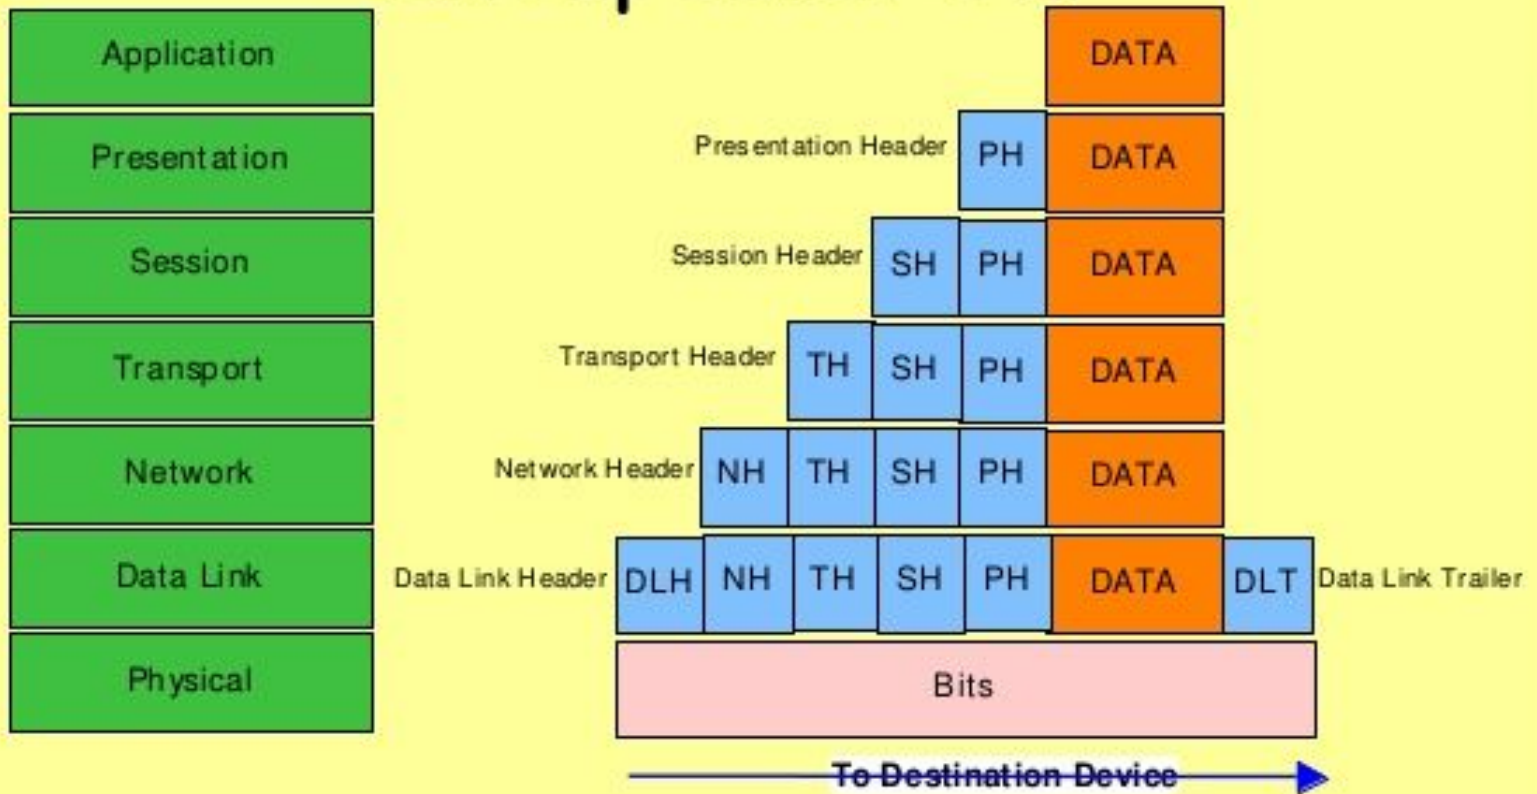

Post address: 050036.MAMYR-2.#7.#2

**MAC-address: 00:0a:95:9d:68:16.**

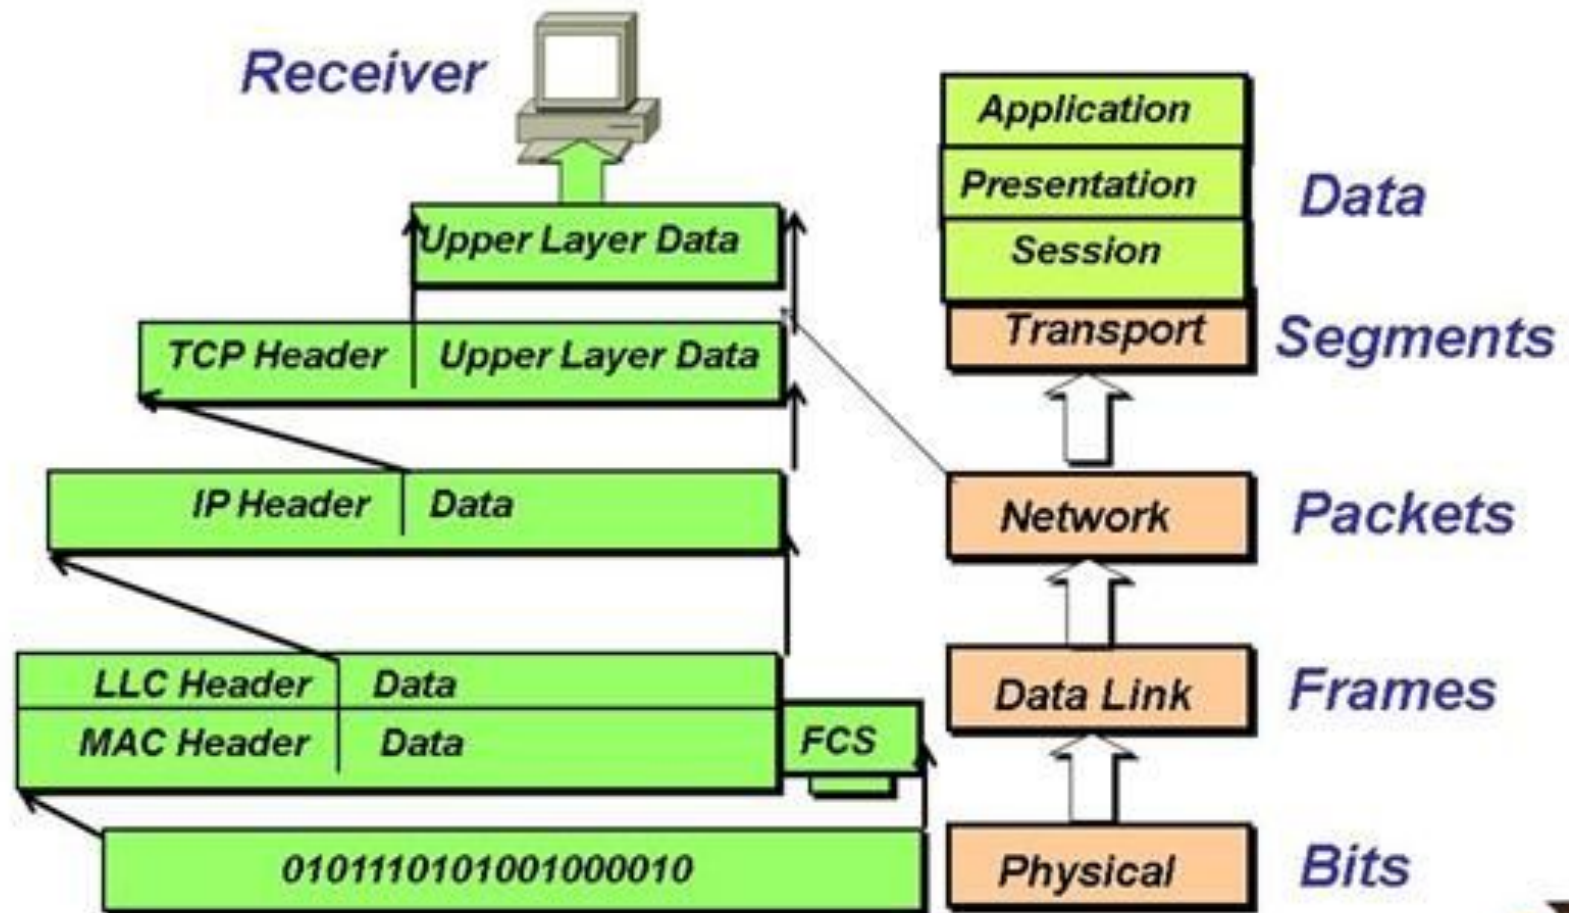

IIN/ID: 560601302855/012601563

# TCP/IP Model - Summary

- Application or Process Layer - concerned with how data at both ends is handled.
- Transport Layer - manages flow of data
- Internet Layer - consists of several protocols, primary protocol is IP (providing hierarchical addressing scheme)
- Data Link (or Network Interface) Layer - manages transmission of data within the network
- Physical Layer - not really defined, TCP/IP leaves the physical connection to manage itself

TCP/IP	OSI Model	Protocols
Application Layer	Application Layer	DNS, DHCP, FTP, HTTPS, IMAP, LDAP, NTP, POP3, RTP, RTSP, SSH, SIP, SMTP, SNMP, Telnet, TFTP
	Presentation Layer	JPEG, MIDI, MPEG, PICT, TIFF
	Session Layer	NetBIOS, NFS, PAP, SCP, SQL, ZIP
Transport Layer	Transport Layer	TCP, UDP
Internet Layer	Network Layer	ICMP, IGMP, IPsec, IPv4, IPv6, IPX, RIP
Link Layer	Data Link Layer	ARP, ATM, CDP, FDDI, Frame Relay, HDLC, MPLS, PPP, STP, Token Ring
	Physical Layer	Bluetooth, Ethernet, DSL, ISDN, 802.11 Wi-Fi

Application	Description
<b>DHCP</b>	Dynamic Host Configuration Protocol assigns IP addresses
<b>DNS</b>	Domain Name System translates website names to IP addresses
<b>HTTP</b>	Hypertext Transfer Protocol used to transfer web pages
<b>NBNS</b>	NetBIOS Name Service translates local host names to IP addresses
<b>SMTP</b>	Simple Mail Transfer Protocol sends email messages
<b>SNMP</b>	Simple Network Management Protocol manages network devices
<b>SNTP</b>	Simple Network Time Protocol provides time of day
<b>Telnet</b>	Bi-directional text communication via a terminal application
<b>TFTP</b>	Trivial File Transfer Protocol used to transfer small amounts of data

# DHCP

- Dynamic Host Configuration Protocol

# Dynamic Host Configuration Protocol (DHCP)

- ❖ DHCP is a protocol that allows client computers to automatically receive an IP address and TCP/IP settings from a Server.
- ❖ Allows servers to assign or lease IP addresses to computers and other devices that are enabled as DHCP clients on the network.
- ❖ All DHCP messages are carried in *User Datagram Protocol (UDP)* datagrams using the well-known port numbers 67 (from the server) and 68 (to the client).

Number	Topic
802.1	Overview and architecture of LANs
802.2 ↓	Logical link control
802.3 *	Ethernet
802.4 ↓	Token bus (was briefly used in manufacturing plants)
802.5	Token ring (IBM's entry into the LAN world)
802.6 ↓	Dual queue dual bus (early metropolitan area network)
802.7 ↓	Technical advisory group on broadband technologies
802.8 †	Technical advisory group on fiber optic technologies
802.9 ↓	Isochronous LANs (for real-time applications)
802.10 ↓	Virtual LANs and security
802.11 *	Wireless LANs
802.12 ↓	Demand priority (Hewlett-Packard's AnyLAN)
802.13	Unlucky number. Nobody wanted it
802.14 ↓	Cable modems (defunct: an industry consortium got there first)
802.15 *	Personal area networks (Bluetooth)
802.16 *	Broadband wireless
802.17	Resilient packet ring

# Thank You
