The Introduction of Disposable Fluff Pads

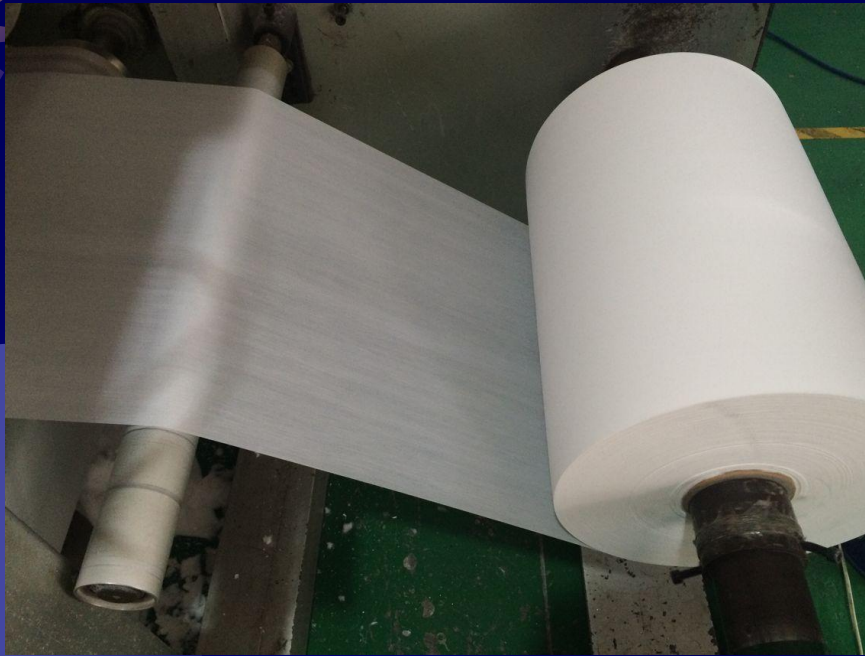

- The fluff pads are composed of 5 layers:
 - Nonwoven
 - Top-sheet tissue
 - Fluff pulp
 - Back-sheet tissue
 - PE film
- If the super absorbent powder is needed, it will be added in the pads by mixing it with the fluff pulp

The Procedures of Production

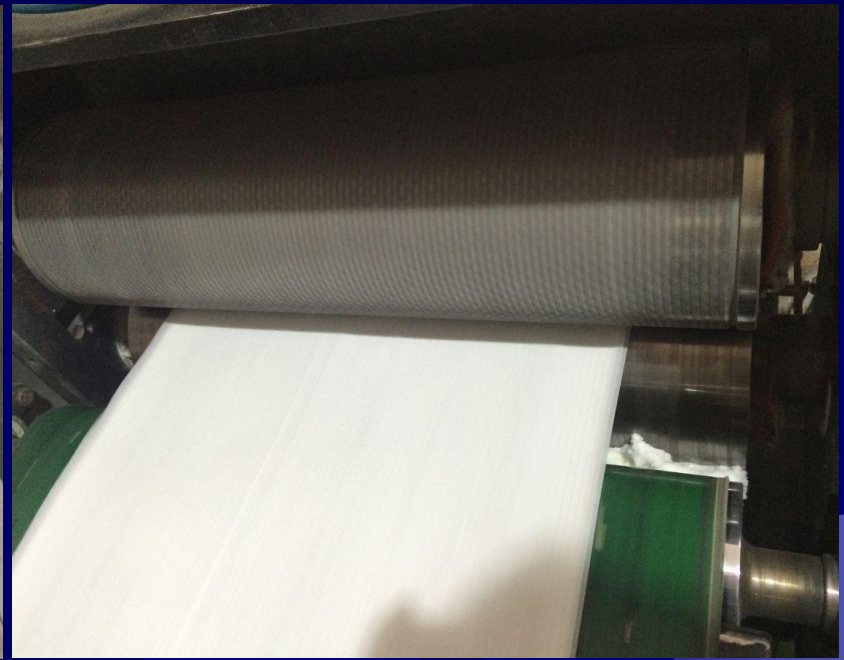

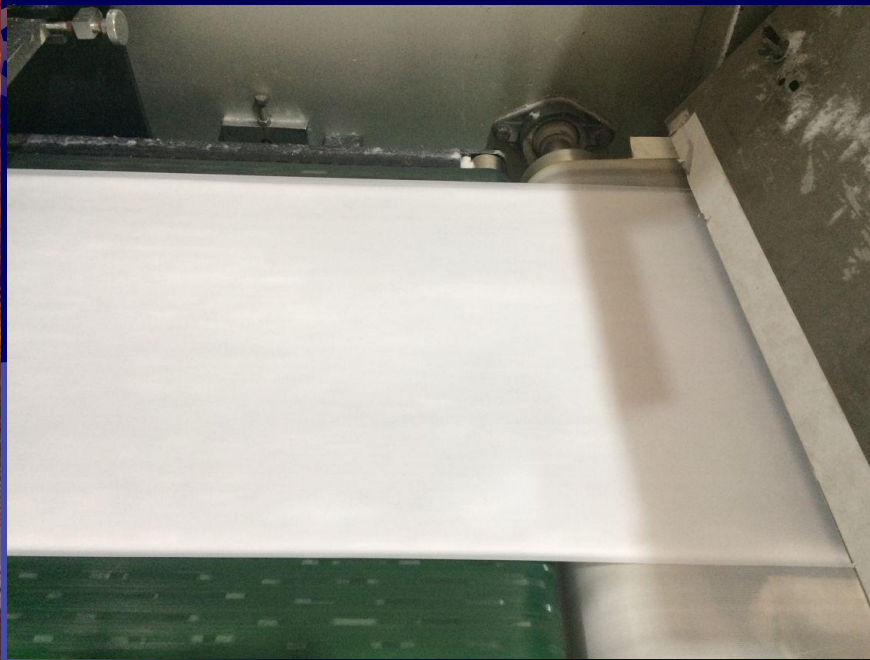

the fluff pulp rolls are loaded on the machine and broken up into powder fibers by the hammer mill

the back-sheet and top-sheet tissues carry the fluff pulp fiber and transfer it to the next step, embossment

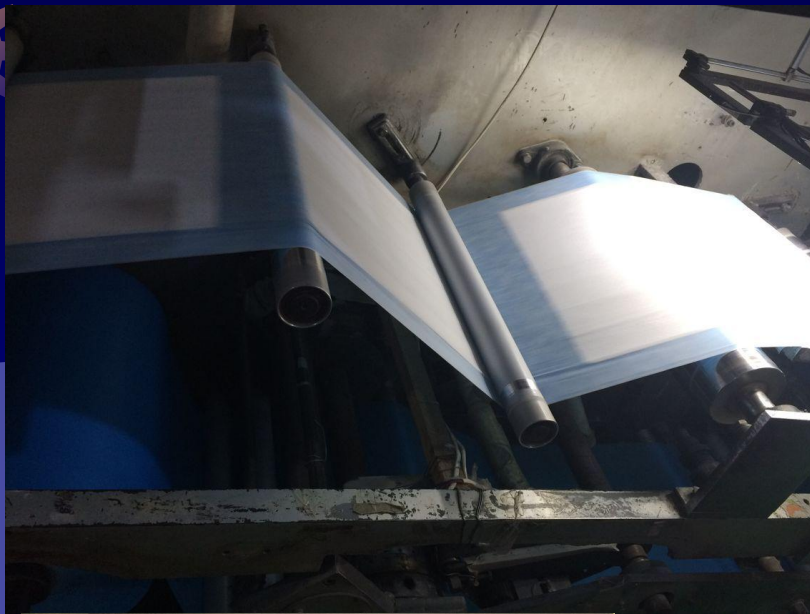

two layers of tissue with the fluff pulp fiber in between, is being embossed—forming the core

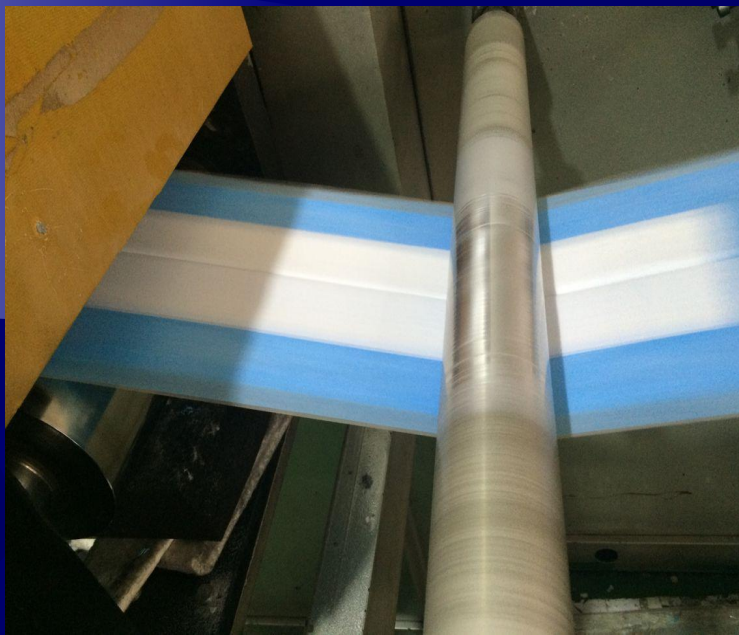

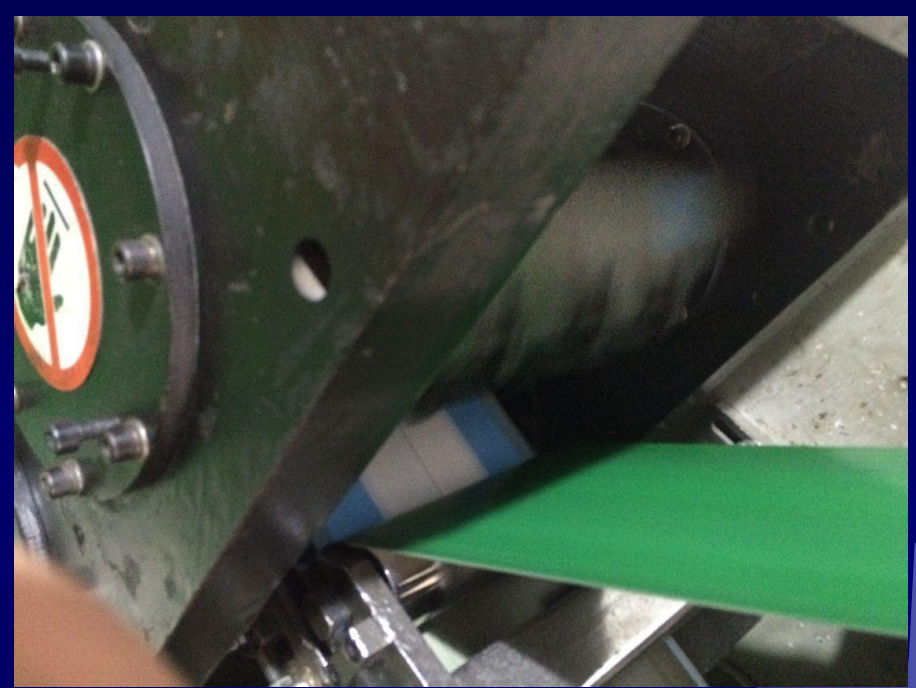

the cutter cuts the core to the size that is programmed in advance

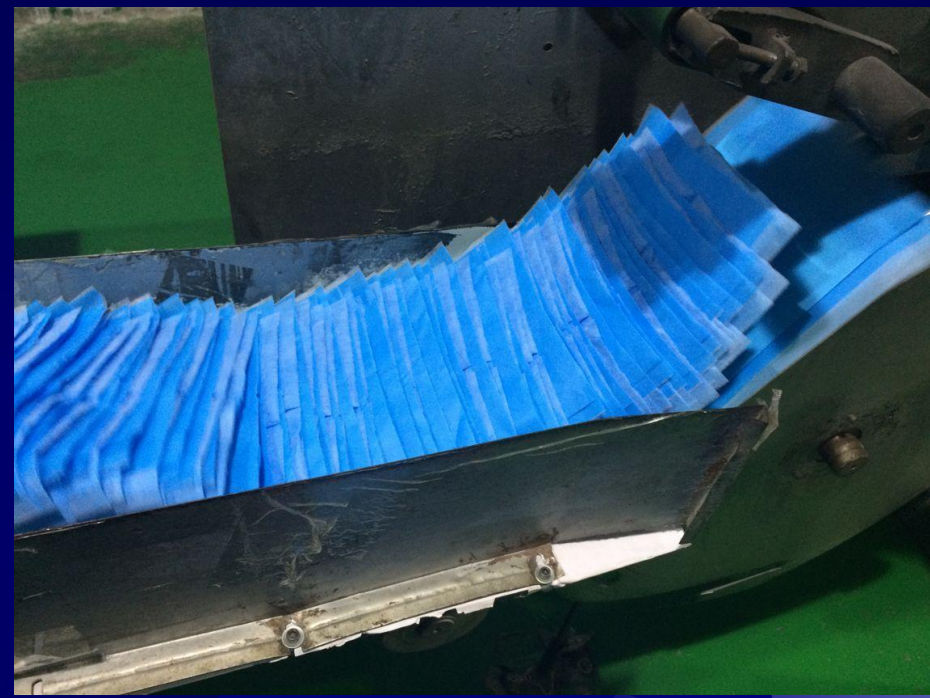

Meanwhile, the nonwoven and PE film are being transferred to meet with the embossed core; and being lightly glued together. During this progress, if required, the adhesive tapes can be added in the PE film.

the Spots monitor screens the entire long sheet on line. The alarm goes off if any foreign material is detected.

The sheet is transferred to the second cutter, being cut to the designed size and folded at the same time.

Now, the under pads are completed,
ready for being packed

Conclusion

- Quality is utmost important matter to us
- Satisfactory customer service is what we strive for everyday.
