

Presentation on theme:  
**“My Future Speciality”**

VSIET 2016

I study at the Mechanical faculty of the Voronezh State University of Engineering Technology. My future speciality is a mechanical engineer at the food enterprise.

I consider this speciality to be one of the most interesting at our university. To become qualified specialists we must know all the latest achievements in science and engineering.

After university from the academy I am going to work at a food enterprise. But maybe I shall work in trade or in my own business. Some of the graduates of our university work at research institutes or at experimental offices, some happen to become directors or managers of big enterprises.

As for me, I'D like to work in a joint venture (to take part in scientific investigations of our department). Of course it's very difficult to choose our road in life and to find a good job due to many reasons, but I hope for the best.

The food industry is an important branch. The scientists of our university work in different fields of knowledge. Those students who are interested in research and are successful in their studies have opportunities to be trained abroad.

The administration of our academy have established contacts with educational institutions of China, Germany, the USA etc. Some graduates take post-graduate course upon graduating from the university.
