#### APPLICATIONS OF SEMIRINGS

Postgraduate student: I.V. Diveikin

Academic adviser: V.B. Poplavski Language adviser: D.A. Alexeeva

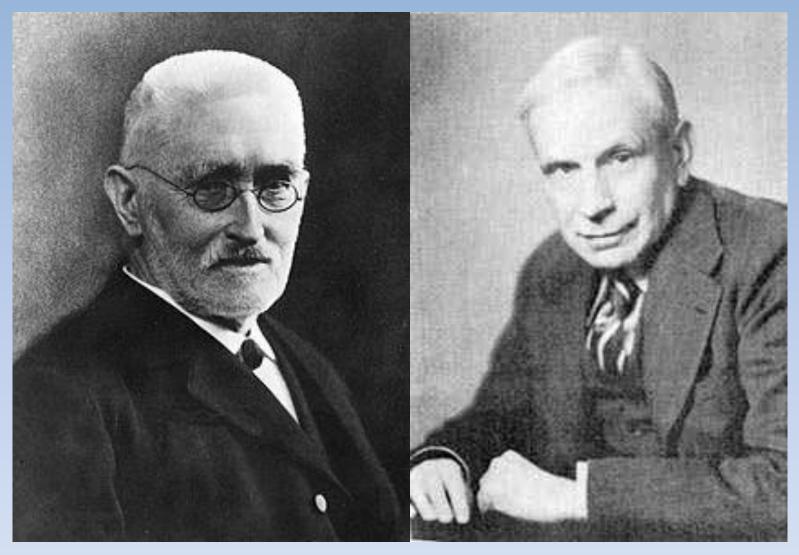

# What are semirings?

A semiring is an algebraic structure  $(R, +, \bullet)$ , consisting of a nonempty set R on which we have defined two operations, addition + and multiplication

- · such that the following conditions hold:
- 1. Addition is associative and commutative and has a neutral element:

$$a + b + c = (a + b) + c$$
  $a + b = b + a, a + 0 = 0 + a$   $a, b, c \in R$ 

- 2. Multiplication is associative and has a neutral element: a(bc) = (ab)c, for a = ac .  $a,b,c \in R$
- 3. Multiplication is distributive with respect to addition: a(b+c) = ab + ac and (a+b)c = ac **for**  $a,b,c \in R$
- 4. There is a neutral element regarding multiplication: a0 = 0a = 0, for  $a,b,c \in R$

**Harry Schultz Vandiver** 

# Automata theory Tropical semiring

The *tropical semiring* is the semiring ( $\mathbb{Z} \cup \{\infty\}, \min, +)$  with the operations:

- $\bullet a \oplus b = \min(a,b); a,b \in \mathbb{Z} \cup \{\infty\}$
- $\blacksquare a \otimes b = a + b; a, b \in \mathbb{Z} \cup \{\infty\}$

## Optimization theory

Schedule algebra is a semiring ( $\mathbb{Z} \cup \{-\infty\}_{M} \mathbb{R}$ ) he operations:

- $a \oplus b = \max\{a,b\}$
- $\bullet a \otimes b = a + b$

Optimization Algebra is a semiring  $(\square \cup \{+\infty\}_{M})$  the operations:

- $\bullet a \oplus b = \min\{a, b\}$
- $\bullet a \otimes b = a + b$

#### Algebras of formal processes

Algebra of communicating processes consists of a finite set R of atomic actions among which there is a designated action  $\delta$  (= "deadlock"). On the set R we define two operations, addition (usually called **choice**) and multiplication (usually called **communication merge**) in such a manner that  $\delta$  is the neutral element with respect to addition and that R, together with these operations, is a semiring.

### Combinatorial optimization

For a given positive integer *n* and a given set *S* of

elements of 
$$N^n \subset \mathbb{Z}$$
 and a vector  $v = \begin{bmatrix} a_1 \\ \mathbb{Z}, \\ a_n \end{bmatrix}$  when  $\mathbb{Z}$  was a final  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t = \min \{ v \in \mathbb{Z} \}$  and  $t \in \mathbb{Z}$  and  $t = \infty \}$  and  $t = \infty \}$  and  $t = \infty \}$  and  $t = \infty \}$ 

to find  $t_v = \min\{v \cdot y_i | y_i \in \mathcal{E}\}$  is the usual dot product in .

## **Traveling Salesman Problem**

n is be the number of edges in the given graph, the set S is

the set of all possible paths, where  $\begin{bmatrix} c_1 \\ \mathbb{Z} \end{bmatrix} \in S$  means that  $\begin{bmatrix} c_n \\ \end{bmatrix}$ 

there is a path in which, for each  $1 \le h \le n$ , the edge h

appears  $C_h$  times,  $v = \begin{bmatrix} a_1 \\ \mathbb{Z} \\ a_n \end{bmatrix}$ , where  $a_h$  is the cost of

traversing edge h.

If we consider this calculation in the optimization algebra, we see that  $t_v + p(e_1, ..., a_n)$ 

$$p(X_1, \dots, X_n) = \sum \left\{ X_1^{c_1} \otimes \dots \otimes X_n^{c_n} \middle| \begin{bmatrix} c_1 \\ \mathbb{Z} \\ c_n \end{bmatrix} \in S \right\} \tag{1}$$

In other words, the problem is reduced to the evaluation of a polynomial in several indeterminates over a semifield.
