

# Microsoft Dynamics Technical Conference

February 2-4, 2015 | Seattle, WA

# Extensibility overview for Microsoft Dynamics AX for Retail – Part II

Piyush Agrawal  
Sr. Solutions  
Architect

Sid Joshi  
Program Manager II

# Agenda

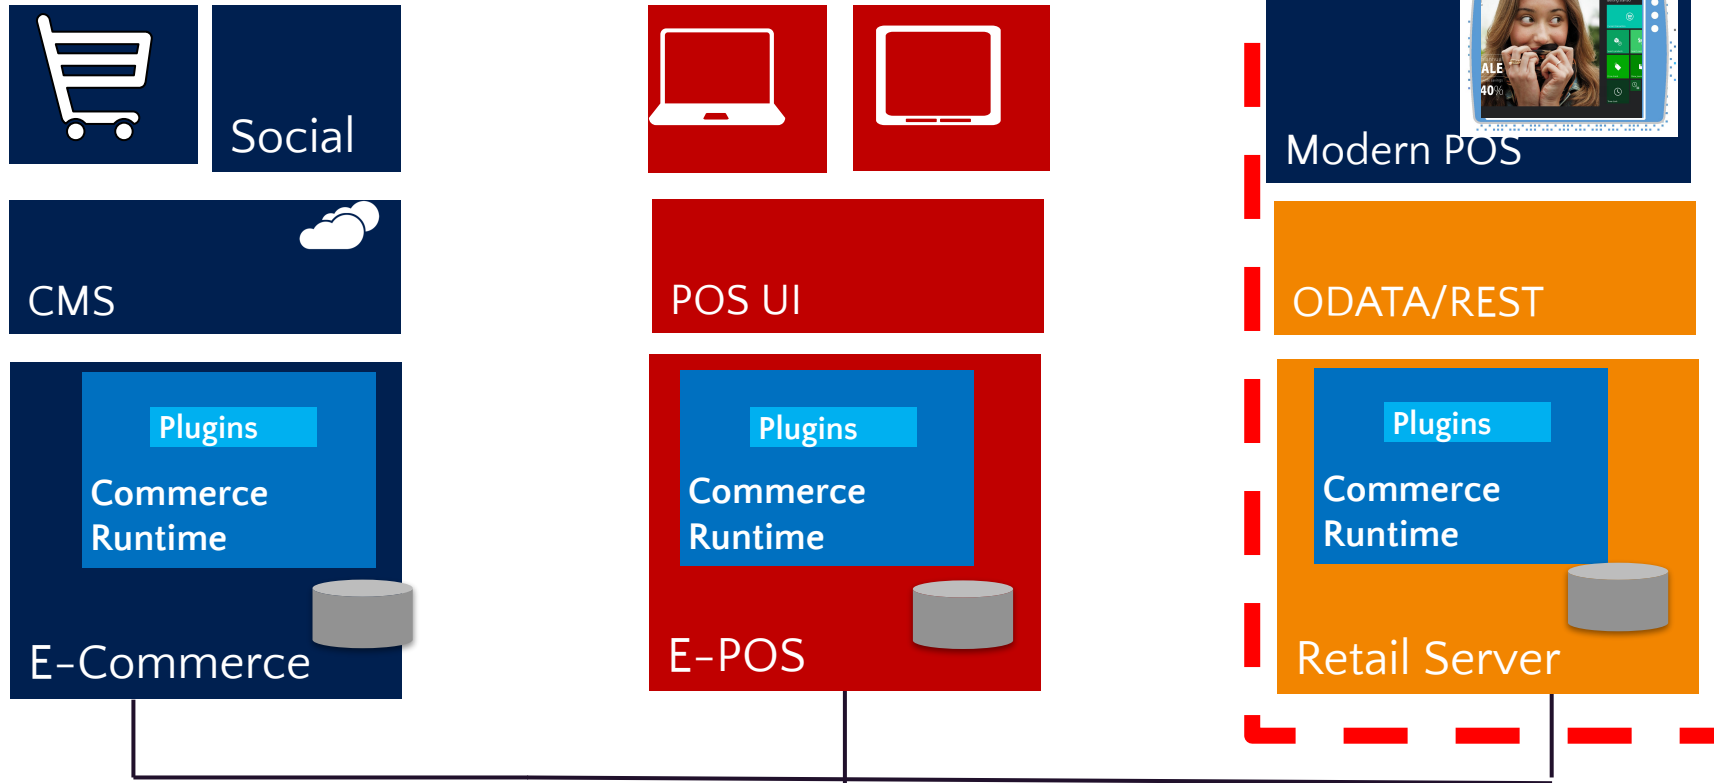

Commerce Runtime extensibility

Retail Server extensibility

Modern POS extensibility

Demo

# Extensible Omni-Channel Retail

## Commerce Data Exchange

**AX for Retail** 

Product Catalog Omni Channel Enrichment Call Center	Merchandizing Pricing Promotions Targeting	Customer Accounts Loyalty Management	BI / Data Mining Transaction history	Store operations Fulfillment Replenishment
---	---	---	---	---

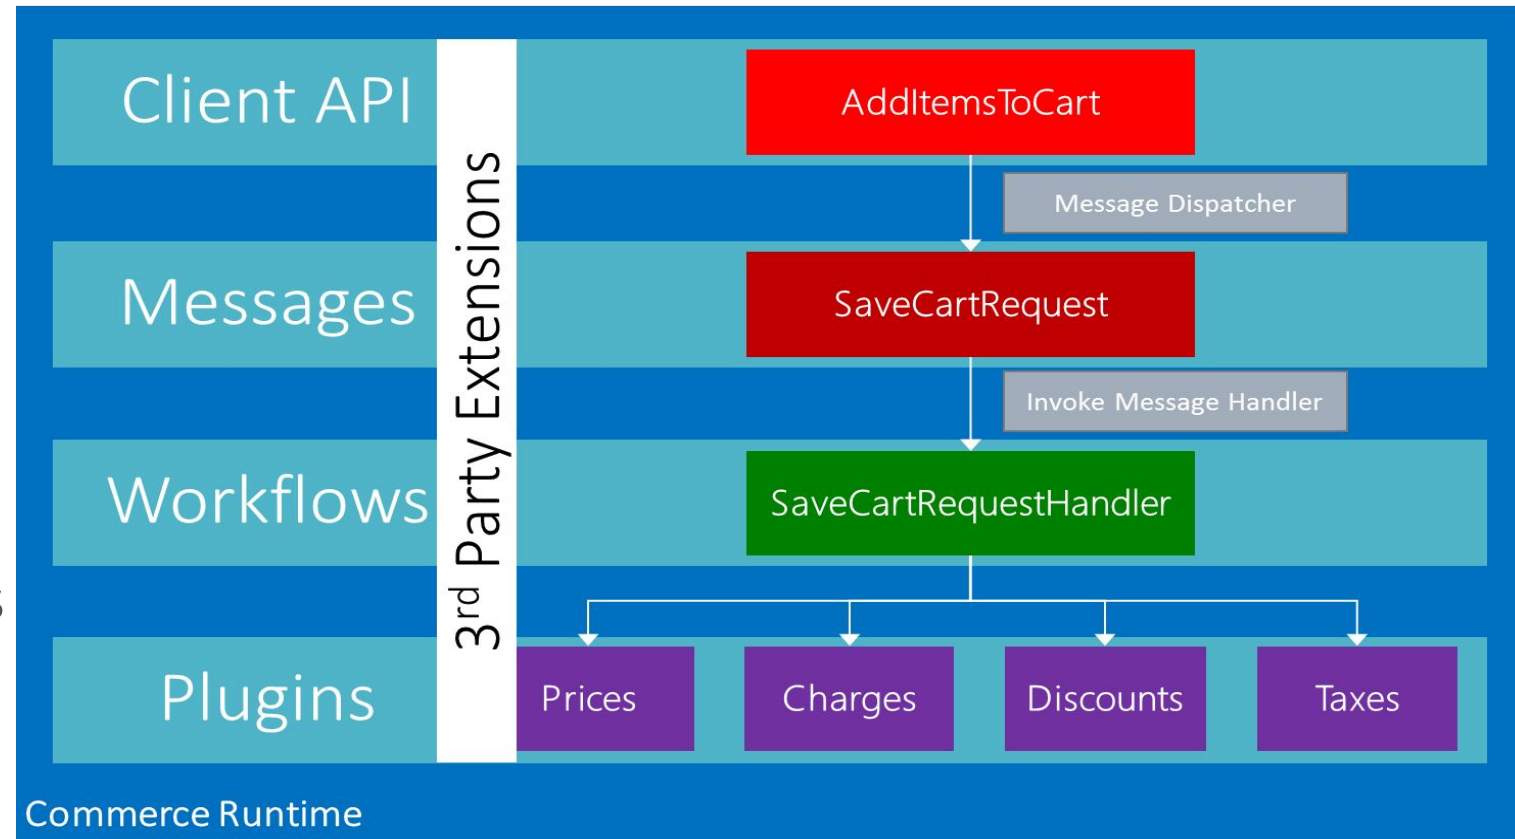

# Commerce runtime

# Commerce Runtime

- Core business logic for commerce across Channels
- Composition pattern for “plug-and-play”
- Symmetric schema across channels
- Built on .Net stack (C#)
- Fully extensible
- PCL complaint (in CU8)

# CRT internals

- **Client** – entry point to the CRT
- **Messages** – contains contracts
- **Workflows** – orchestration layer
- **Plugins** – service implementations that represent atomic operations

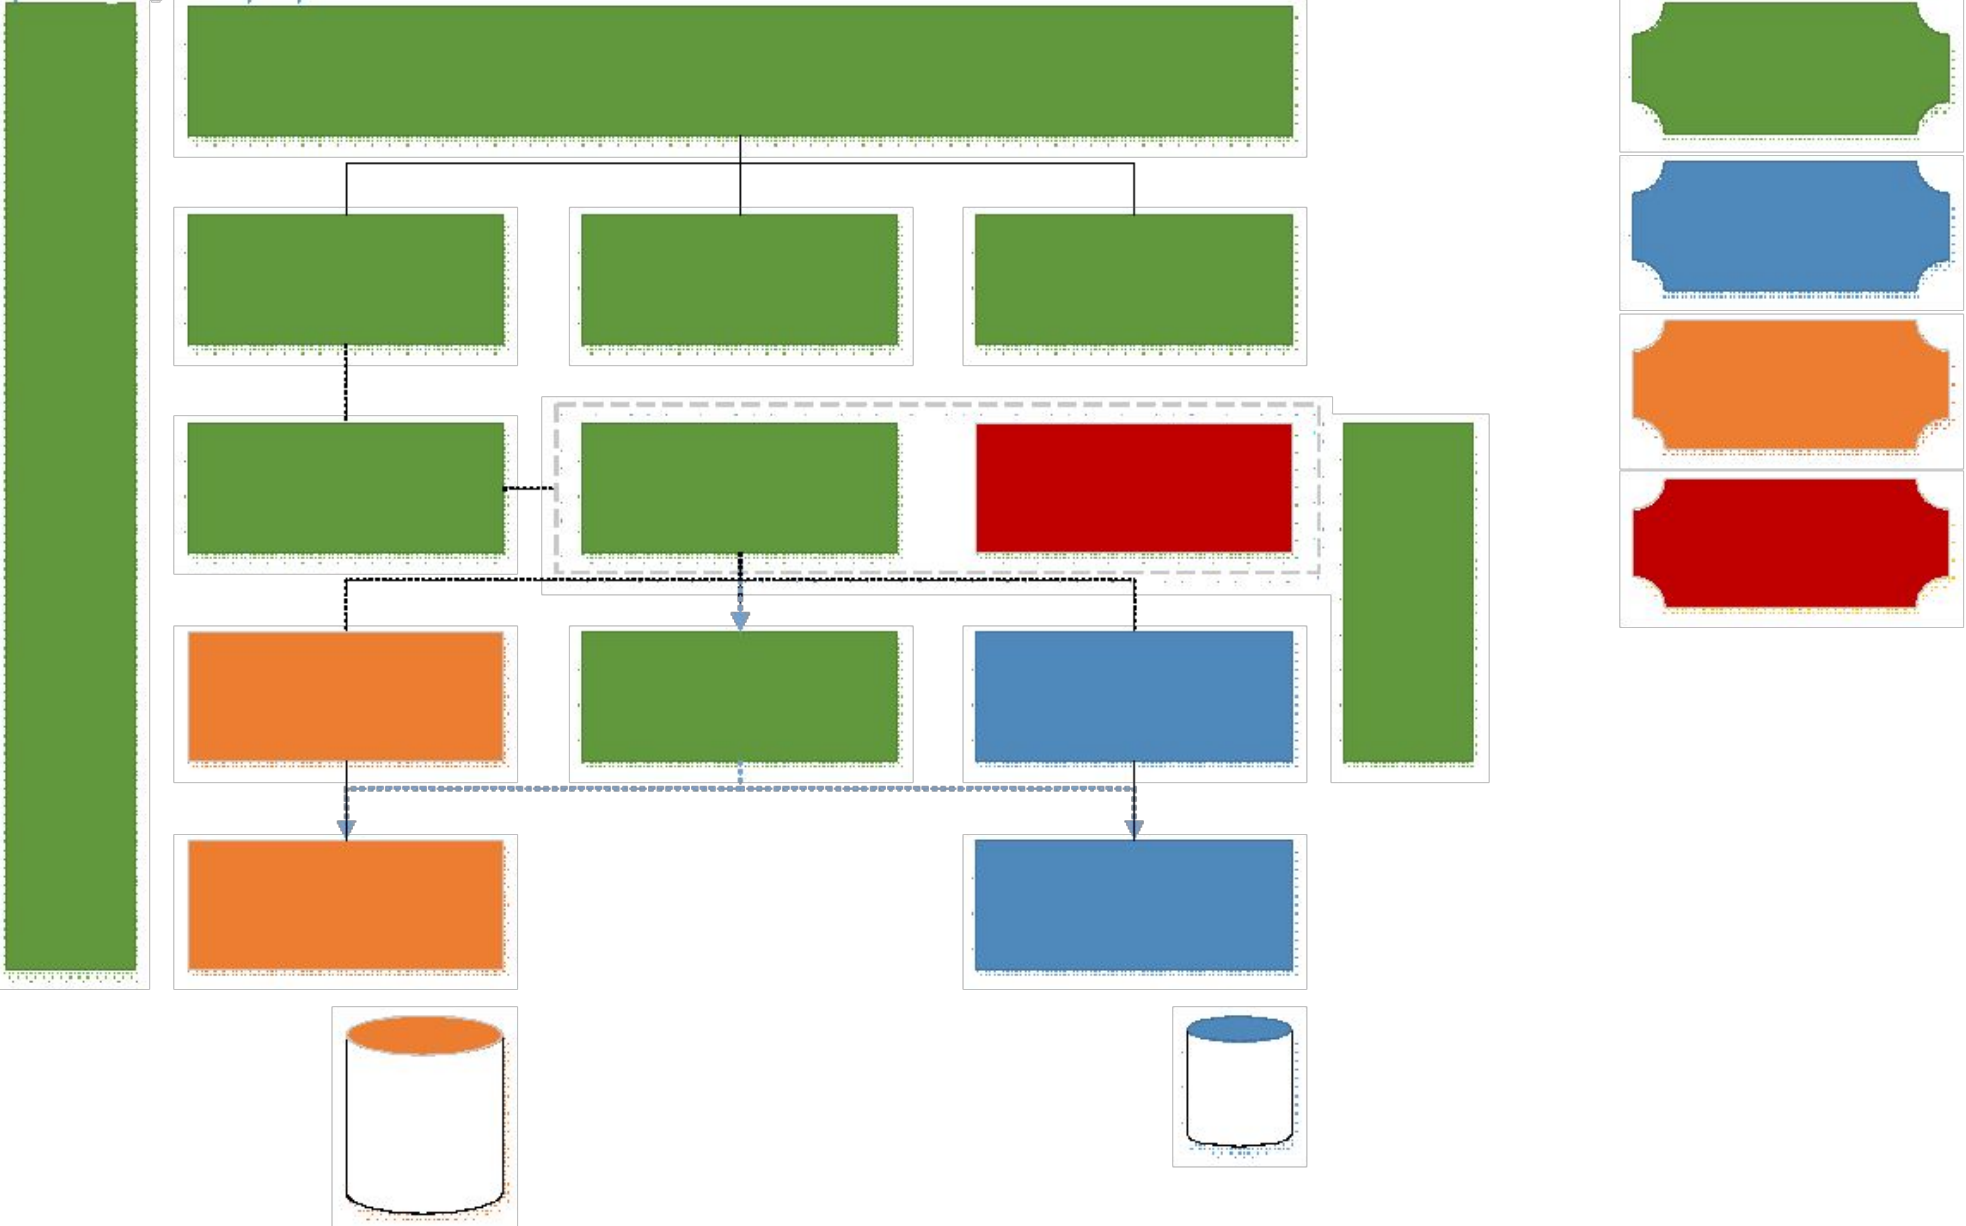

# Extensibility

- All workflows and plugins are implemented using the request and response pattern.
- Handlers can be registered with the runtime and each incoming request is dynamically dispatched to the appropriate handler for execution.
- Handlers are loaded dynamically by the CRT using the Managed Extensibility Framework (MEF).

# Commerce Runtime (CRT) Architecture

# Retail server

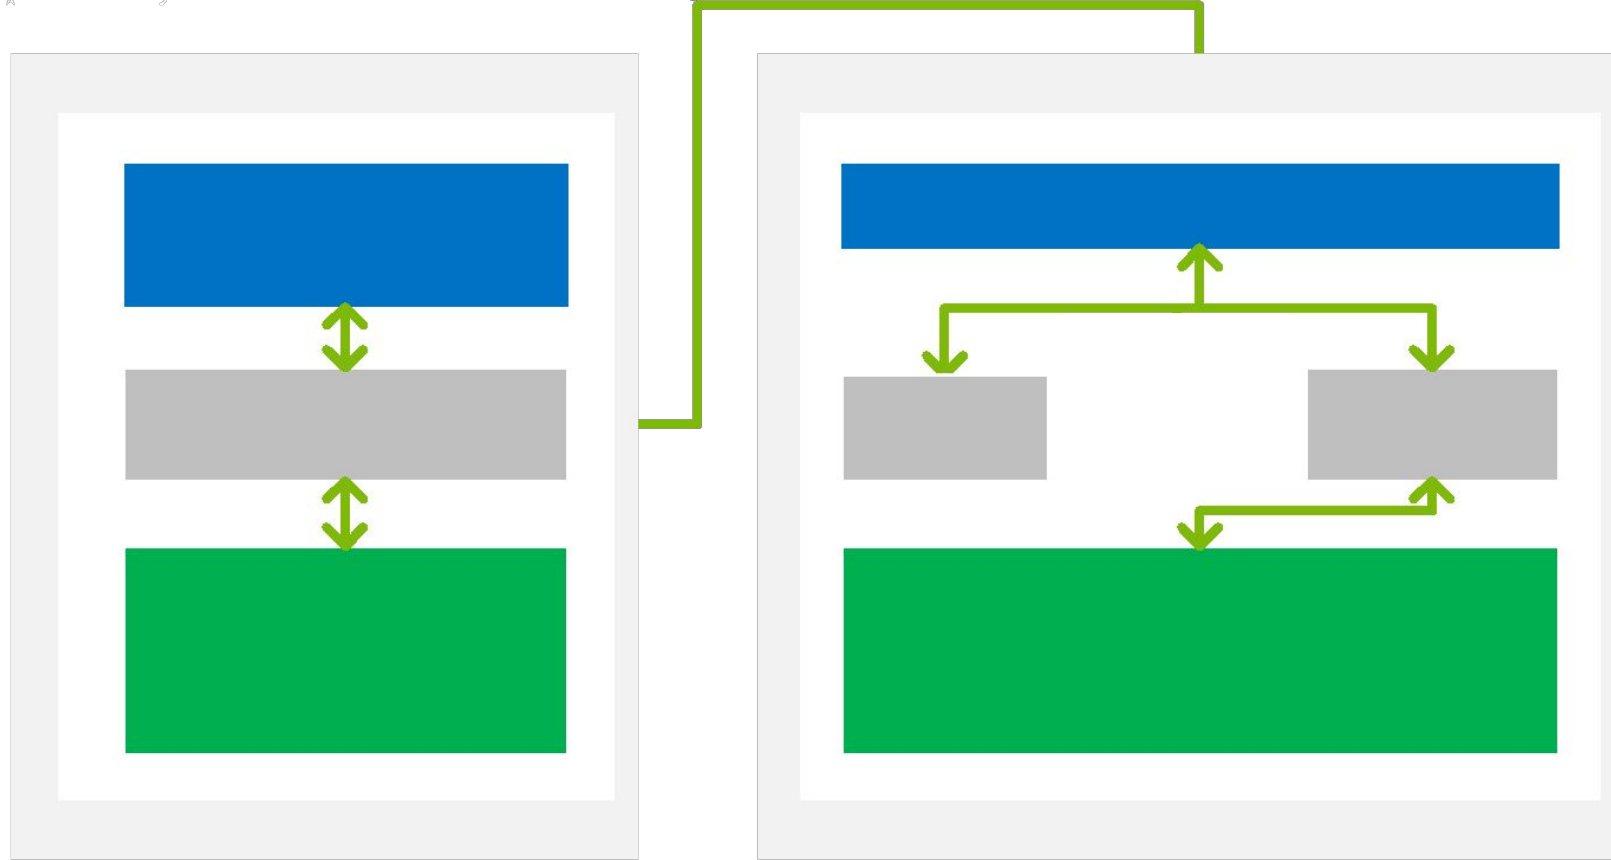

# Retail Server (RS)

- Stateless web service that exposes CRT functionality through an OData web interface.
- Anything outside of CRT is web specific implementation details including but not limited to authentication, authorization, OData extensibility.
- Exposes metadata from which a cross-platform client proxy is generated.

# Retail Server architecture

# Retail Proxy

- Retail proxy abstracts the interface between Retail server and Commerce Runtime
- Handles Local, Remote
  - Local context -> CRT
  - Remote context -> Retail Server
- All the clients use proxy API to interact with the server
- Cross – platform – available both in Java script as well as C#

# Modern POS

# Extensibility Scenarios

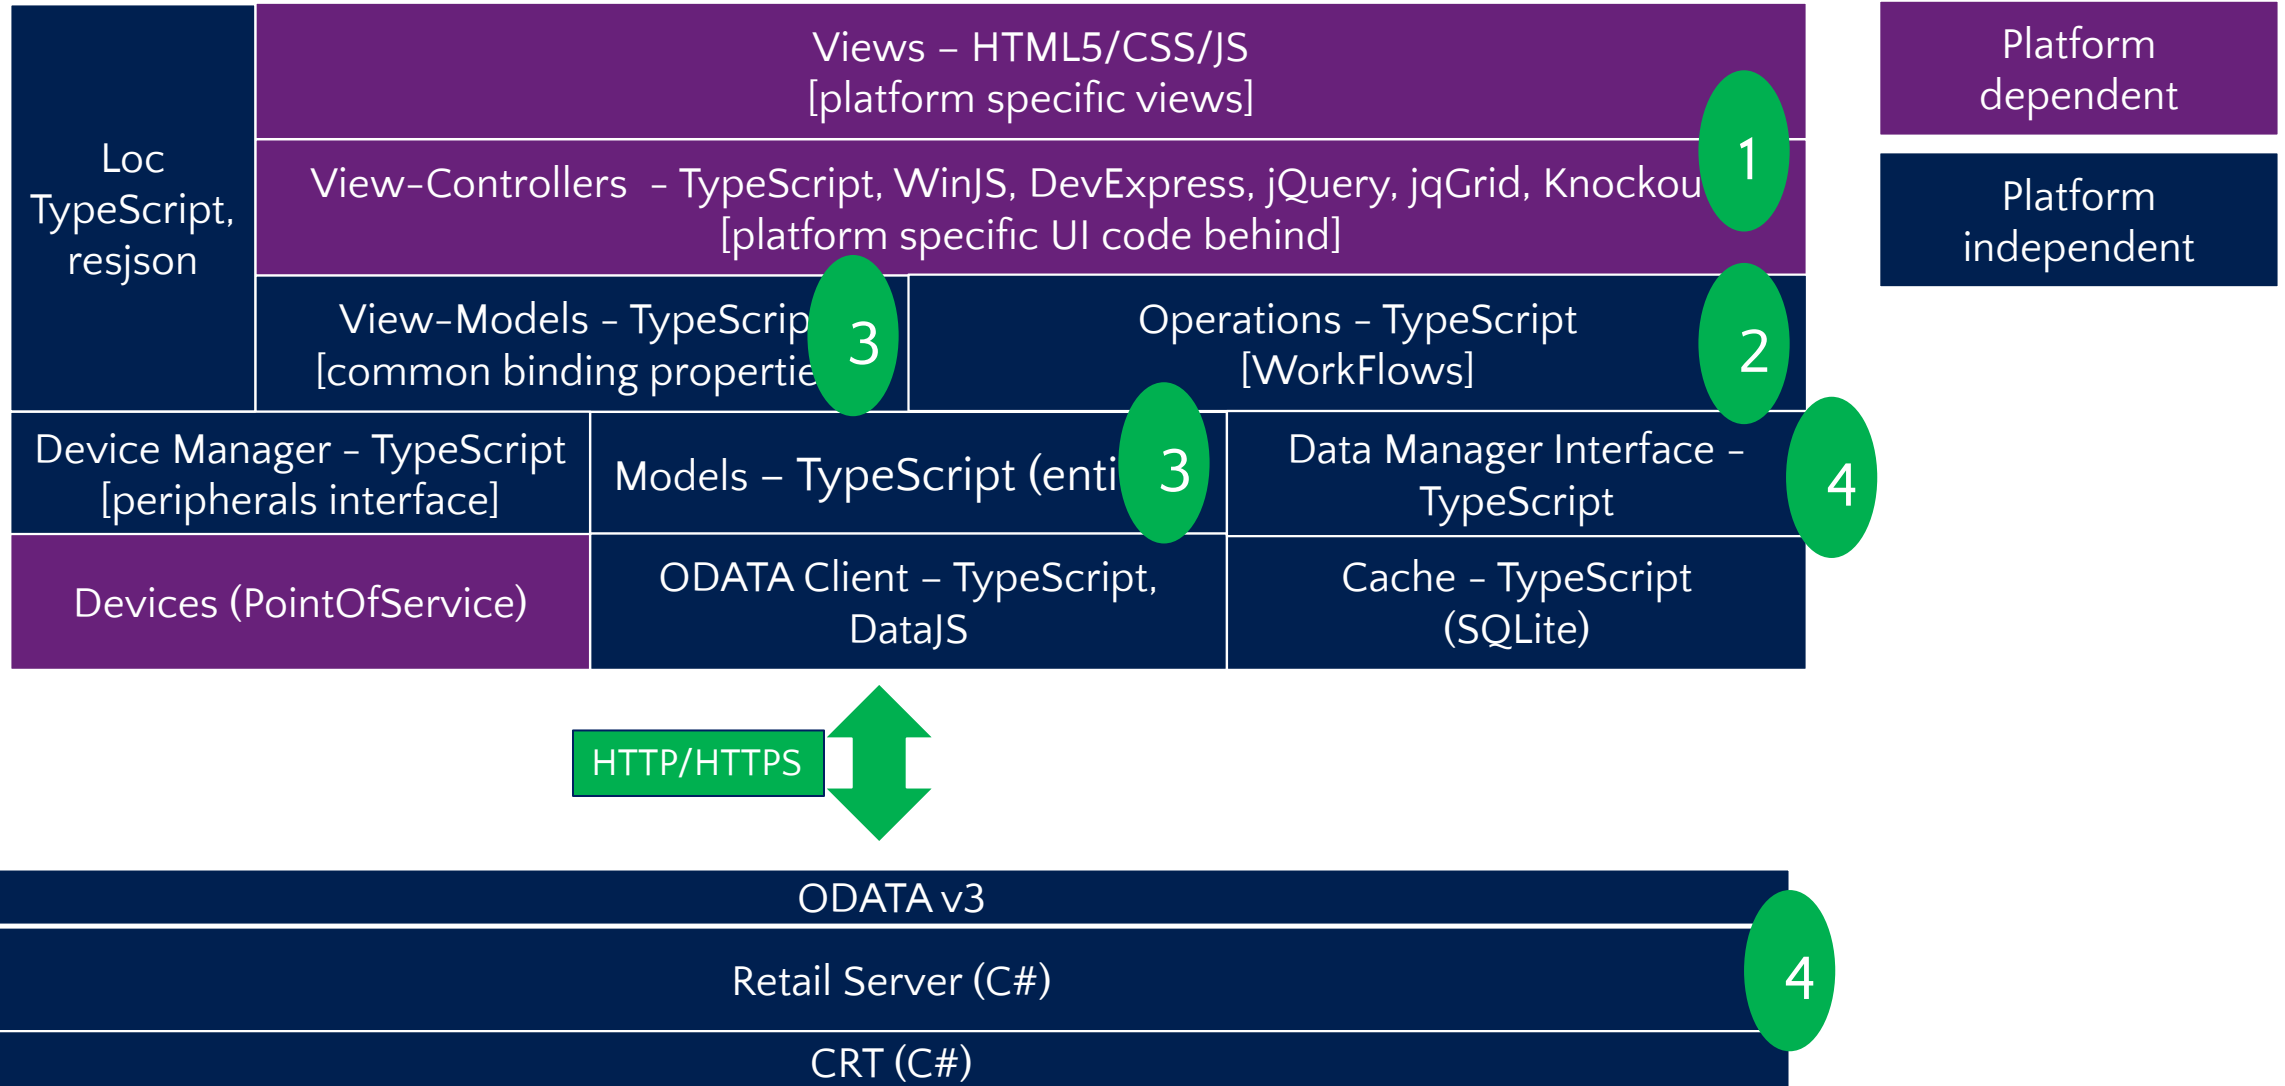

Look and  
Feel

Workflow  
Changes

Extend  
Retail  
Entities

Additional  
Functionality

# Modern POS Architecture

# Modern POS Solution: Core

## Core

### Operations

- Workflow
- Extensive use of activities

### Activities

- “Abstract” classes
- No implementation
- Data contract
- Can have a response handler

### Entities

- Data model only
- CommerceTypes: Retail Server entities

### Managers

- Data managers
- CommerceContext: Retail Server API

### Peripherals

- Peripheral interface

# Modern POS Solution: App

## App

### Views

- HTML pages
- ViewControllers

### Controls

- HTML pages
- Code behind

### Activities

- Activities implementation

### Peripherals

- Native access to peripherals

# Look and Feel Extensibility (View)

## Scenario –

- A Fashion retailer wants to brand the POS for their needs. The retailer wants to change the look and feel of POS. They also have different placement and sizes of the various buttons that appear on the home page.
- HomeScreen View and TransactionScreen view can be designed from the Screen layout designer within AX with support for landscape and portrait orientations

HomeScreen view

Button grids

Banner

TransactionScreen view

Button grids

Totals panel

Customer panel

Line items and payment grid

Tab control

Custom controls

NumPad

Image

- All other views needs to be changed in place

# Entities extensibility

## Scenario

- Contoso wants to collect customer's email preference for email marketing. This is an additional property/attribute on the Customer entity

## Entities can be extended in a programmatic way

- Entities can be extended using Extensibility Helper
- The design can be leveraged to automatically create properties on the fly
- The main target is class types from CommerceTypes (because they contain ExtensionProperties property)

# Entities extensibility

## ExtensibilityHelper Class

```
class ExtensibilityHelper {  
    public extend(typeToExtend: any, propertyName: string, key: string, propertyType: PropertyTypeEnum, enumerable: boolean = false);  
}
```

## Extending Customer entity to add email preference property

```
export interface IExtendedCustomer extends Model.Entities.Customer {  
    emailPrefOptIn: number;  
}
```

```
ExtensibilityHelper.extend(Model.Entities.CustomerClass, "IsPreferred", "ISPREFERRED", PropertyTypeEnum.BooleanValue);  
var customer = new Model.Entities.Customer();
```

```
var extendedCustomer = <IExtendedCustomer>this.customer();  
    this.emailOptIn(extendedCustomer.emailPrefOptIn == 1);
```

# Existing workflow changes

- An operation is composed of multiple activities
- A specific activity can be replaced / added / deleted
- A complete operation may be replaced

# Operations and Activities

## Total Discount Operation workflow

# Adding New Functionality

- Adding new operation in AX
- Add a button in button grid of screen layout and map it to the operation
- Create an operation handler which defines the workflow for the new functionality
- Add client side activity implementation

# Demo Scenario

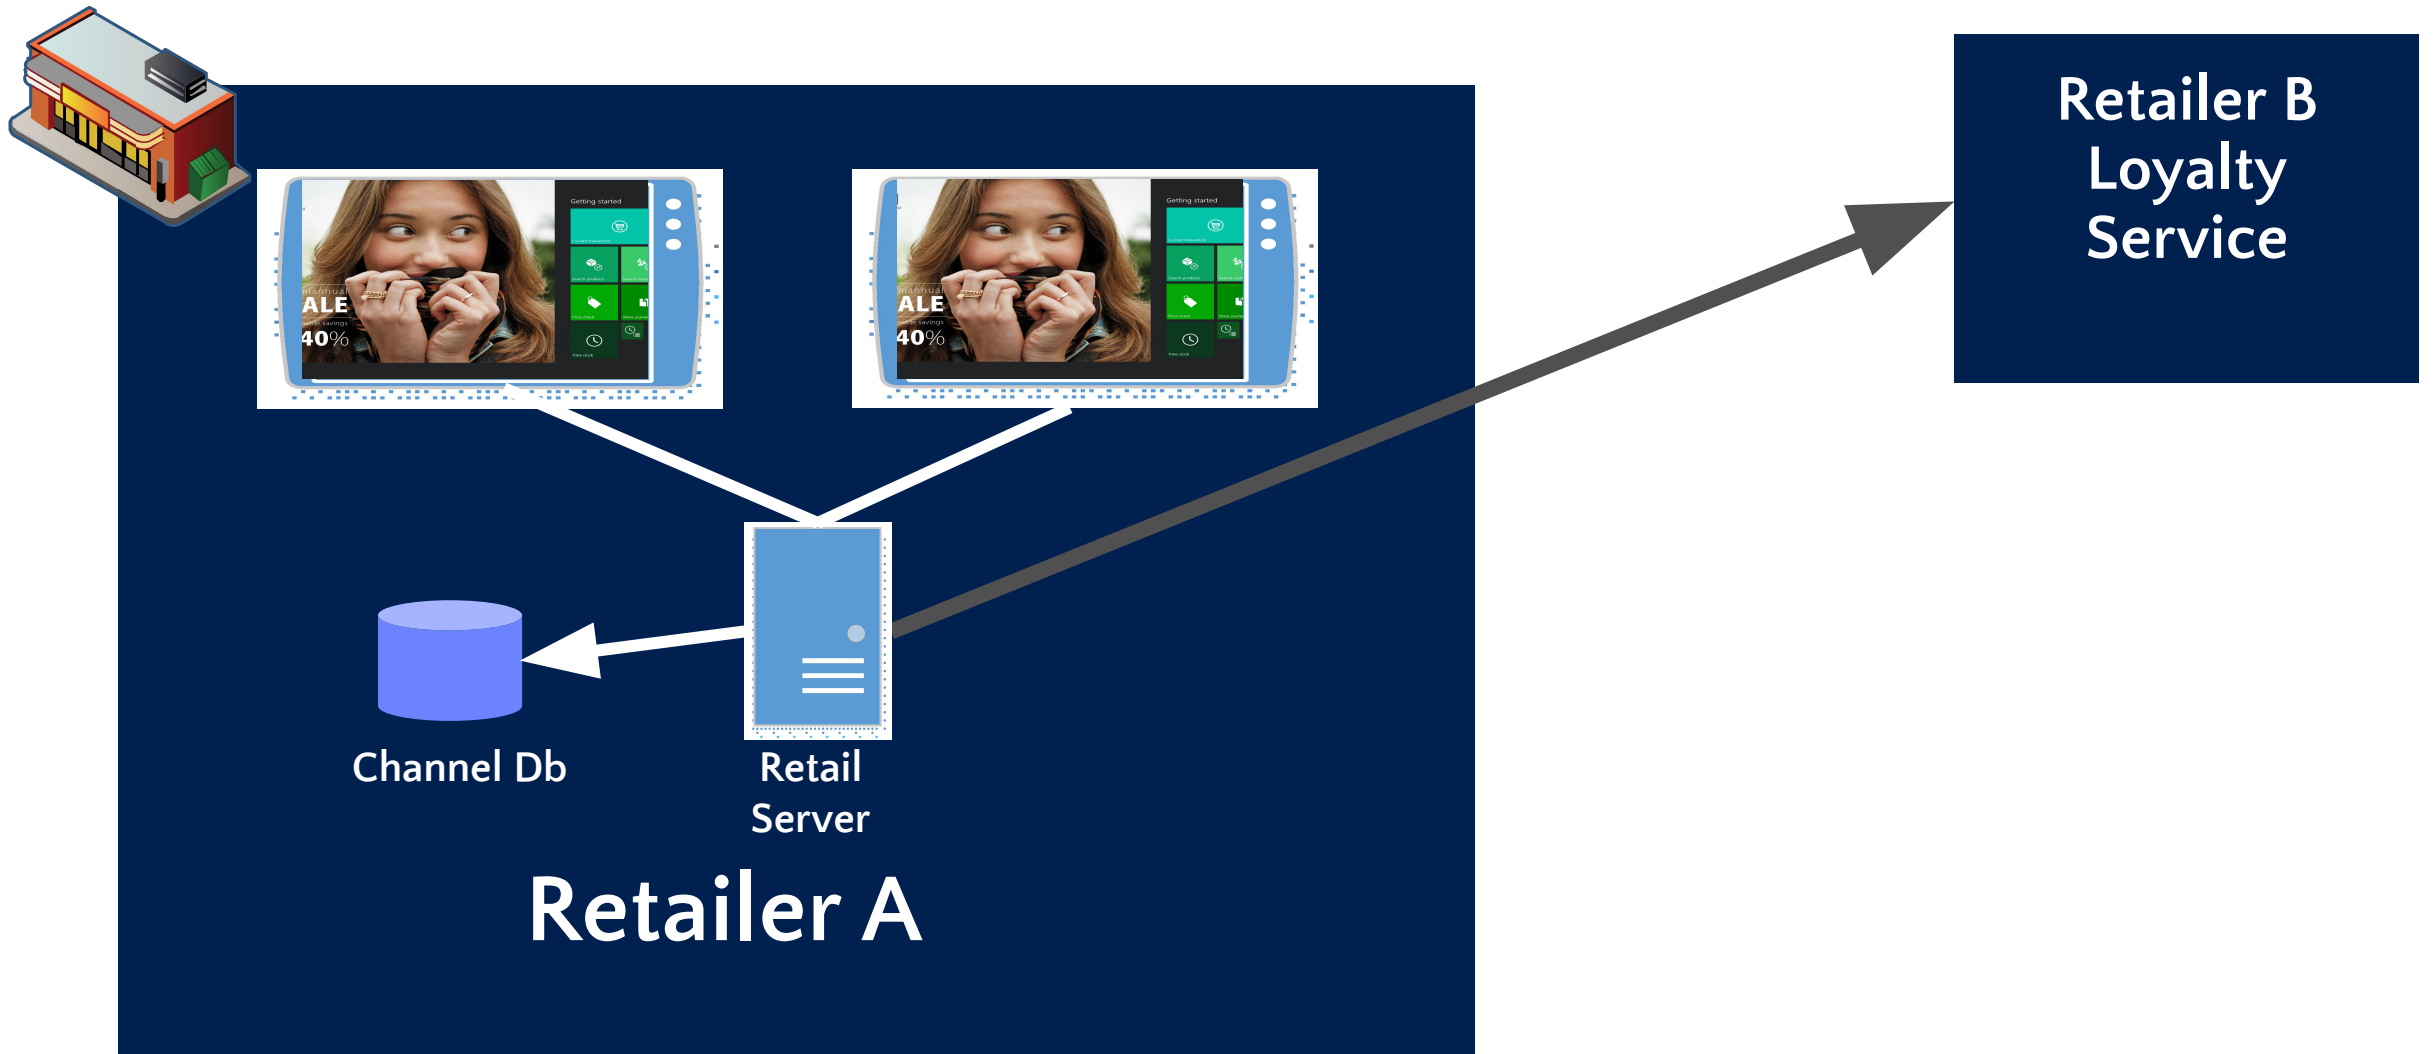

- Third Party Cross Loyalty

Retailer A had a recent partnership with a leading retailer B and as a part of it, Retailer B's customers can enjoy extra discounts while purchasing from Retailer A.

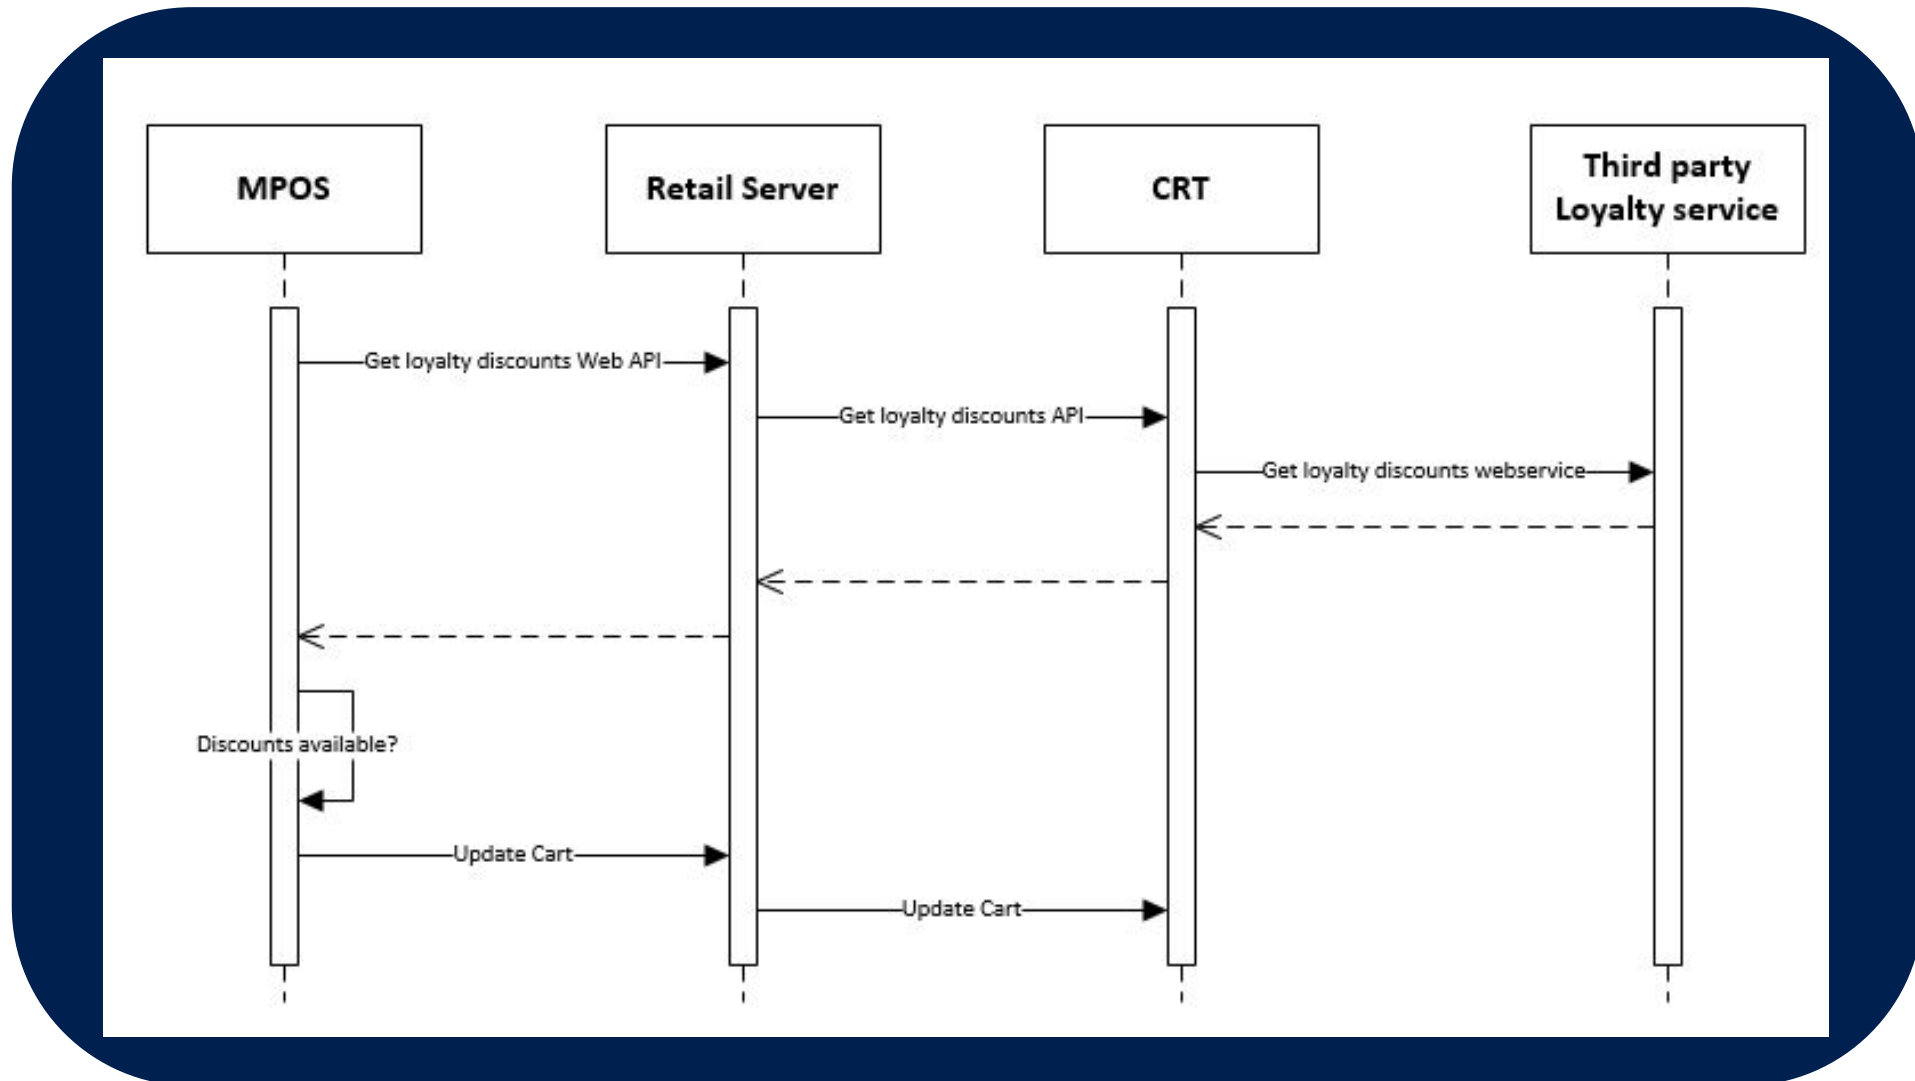

200 points or more in Retailer B Loyalty card = \$4 discount in purchases from Retailer A

100 points or more in Retailer B Loyalty card = \$2 discount in purchases from Retailer A

# Architecture

# High level flow

# Modern POS Changes

Loc TypeScript, resjson	Views – HTML5/CSS/JS [platform specific views]		●
	View-Controllers – TypeScript, WinJS, DevExpress, jQuery, jqGrid, KnockoutJS [platform specific UI code behind]		●
	View-Models – TypeScript [common binding properties,]	Operations – TypeScript [WorkFlows]	●
Device Manager – TypeScript [peripherals interface]	Models – TypeScript (entities)	Data Manager Interface – TypeScript	●
Devices (PointOfService)	ODATA Client – TypeScript DataJS	Cache – TypeScript (SQLite)	●
