« The importance of continuation of space exploration »
School №31
Teacher: Timokhina Elena Sergueevna

Some people say that we should continue the space exploration. But other people believe that space researches are not necessary for human civilization. I think that a sortie into Deep Space is an immortal human's dream.

Space ... a secret territory being so attractive for us for a long time. In the mid-20th century after the most bloody and terrible war in the world, people went into space for the sake of strengthening their military power.

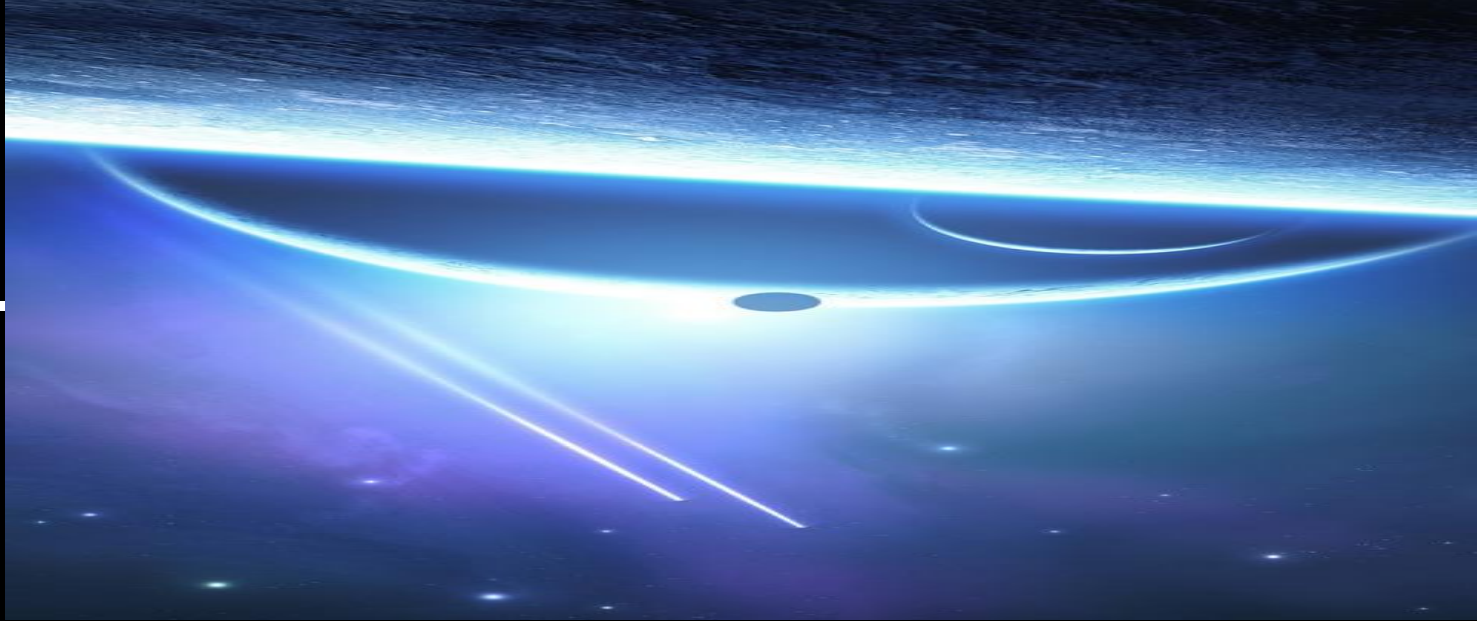

Initially the USSR won the prize. The first Russian Sputnik was sent into space, then the first man, and then the first woman.

But the USA decided to fight back; American astronauts landed on the Moon and walked on its surface. In the mid 70-ies the space program declined and people mastered the closest space, without flying too far.

In my opinion, the deep space needs to be explored further and there are a lot of reasons. Firstly, the number of people on our planet is increasing every day, and one day all people will not have enough space. It is easy to guess that we will need to colonize another planets.

Secondly, we could find necessary metals and gases . Perhaps people could even meet new living beings. We need heroes. All sorts of discoveries have always inspired people. And this is the third reason.

- To some up, there are different meanings about the importance of continuation of space exploration . I believe that travelling to space is a useful thing for scientists, for engineers, for physicians and astronomers, for all people who like discoveries and adventures.
