

hybris Developer Training Part I - Core Platform

Data Modeling

Introduction to the Type System

2. Relations

→ **Java:**

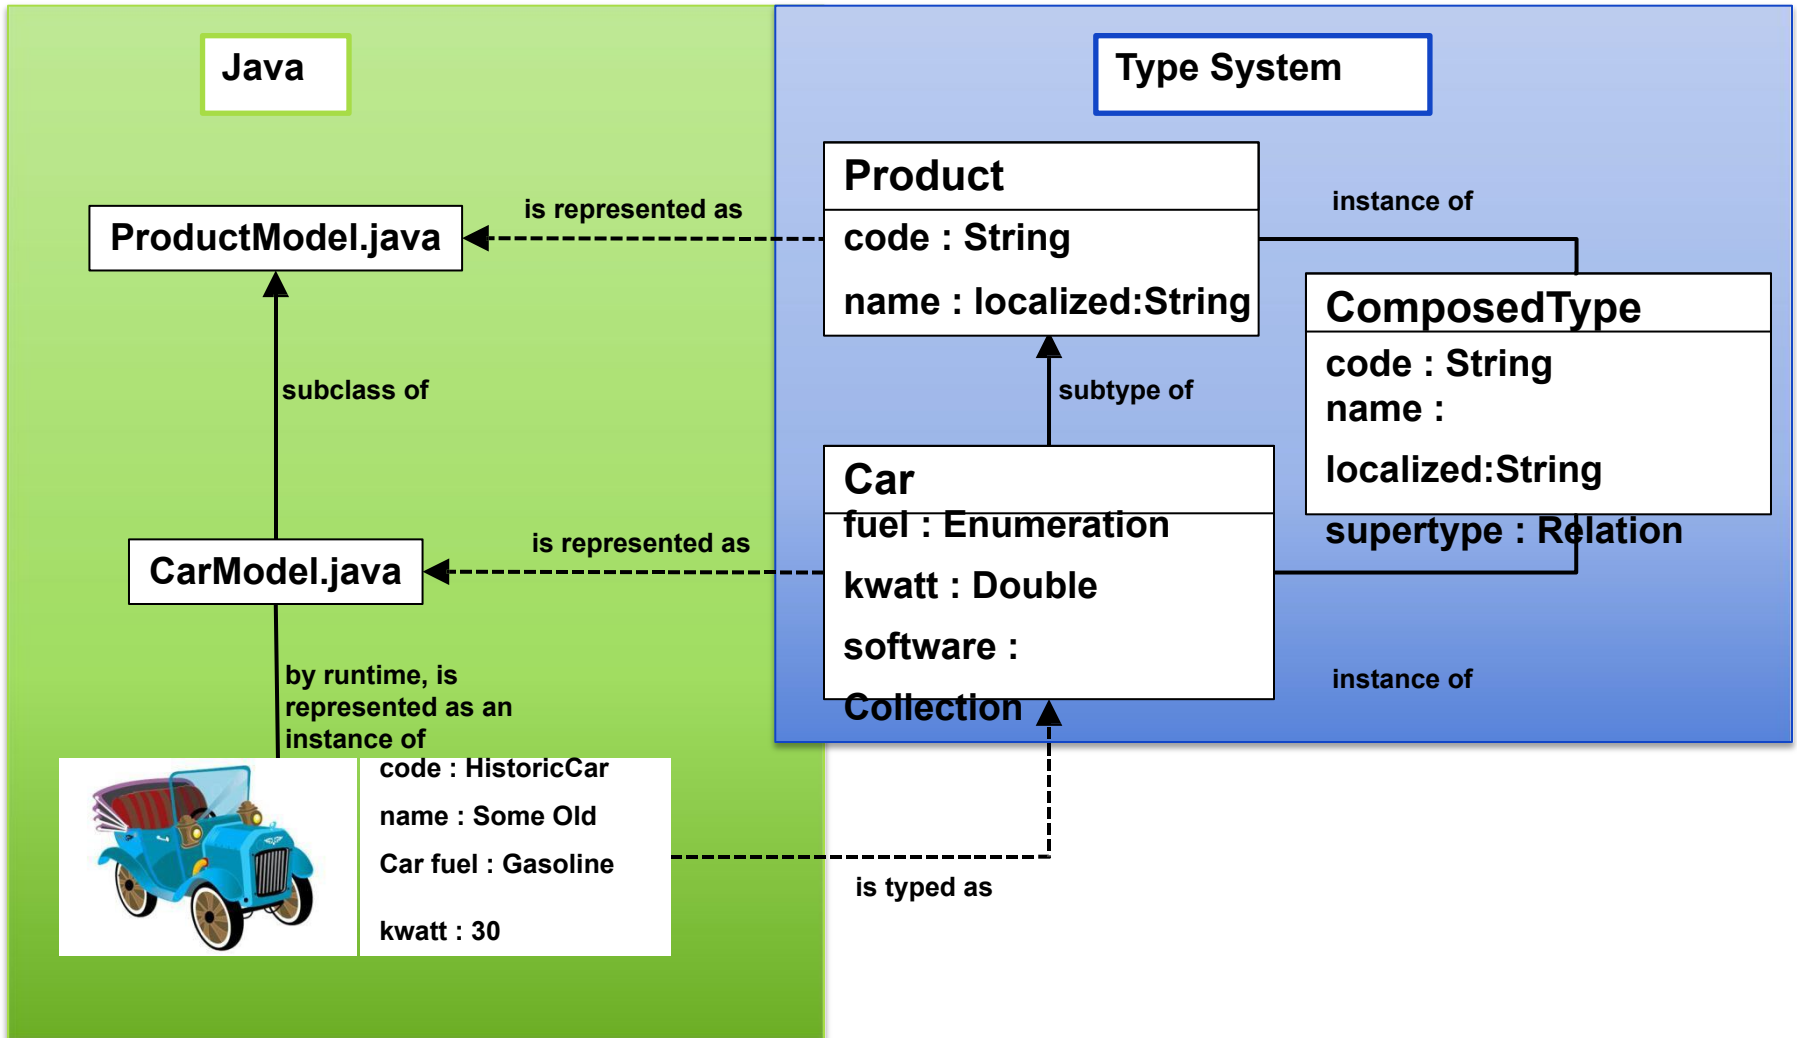

→ **hybris:**

	Data Types	Infrastructure Types
Java:	<ul style="list-style-type: none">java.lang.Booleanjava.lang.Integerjava.lang.Stringjava.util.Datejava.util.Mapjava.lang.Enum	<ul style="list-style-type: none">java.lang.Objectjava.lang.Class
hybris:	<ul style="list-style-type: none">java.lang.Booleanjava.lang.Integerjava.lang.Stringjava.util.DateMapTypejava.lang.Enum	<ul style="list-style-type: none">GenericItemComposedTypeRelation

Java Classes vs hybrid Types

- An attribute in the hybris Multichannel Suite
 - Can be a reference to
 - a basic Java type, called an “atomic type” (for example, the **code** attribute is of type **java.lang.String**)
 - a **composed type** (for example, the **picture** attribute is of type **Media**)
 - Can have a localized name and description (“Image” / “Bild”)
 - Can have a default value

Qualifier	Feature type	Readable	Editable	Optional	Search
catalogVersion	CatalogVersion - Catalog version	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
code	java.lang.String - java.lang.String	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
description	localized.java.lang.String - localized	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
europe1Prices	PriceRowCollectionType - PriceRo	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
name	localized.java.lang.String - localized	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
picture	Media - Media	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
superCategories	CategoryProductRelationSupercat	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
unit	Unit - Unit	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

Enclosing Type:

Feature type:

Extensionname:

Properties

Allows you to define additional details on this attribute.

Name: en
de

Description:

Default Value:

Declared in:

Attributes of a (Composed) Type

PK	code	name	...	mechanic
8796256894977	vehicle01	Ferrari F40	...	8796128083972

product

Atomic type property – value stored directly in db. For instance, property of type String is stored as VARCHAR

Composed type property – reference to another item. The db column stores a **PrimaryKey (PK)** value.

code
name
mechanic

.....> vehicle01
.....> Ferrari F40
.....> Nikola Tesla

PK
8796128083972

name	...
Nikola Tesla	...

users

→ Create new types:

- Define a type by extending already existing types, such as:

```
<itemtype code="Car" extends="Product">
```

- Define “completely new types”, such as:

```
<itemtype code="Car">
```

(implicitly extends from **GenericItem**)

→ Extend existing types:

- Add attribute definitions to existing types (attribute injection), such as:

```
<itemtype code="Product" ...>
```

```
...
```

```
<attribute qualifier="MyAttribute">
```

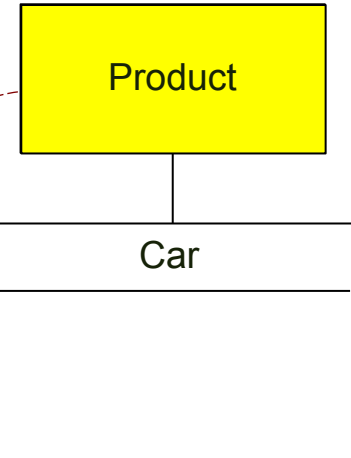

```
</itemtype>
```

Redefine inherited attribute definitions from super type

```
<attribute qualifier="code" redeclare="true">
```

If you change the attribute's java type, the new type must extend the original type

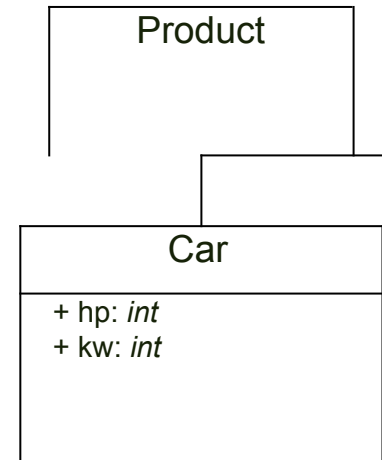

```
<items>

<itemtypes>
  <itemtype code="Car" extends="Product" autocreate="true"
            generate="true"
            jaloclass="de.hybris.platform.lecture.jalo.Car">
    ...
</itemtypes>

- ➔ By default, all items for subtypes are stored in the same database tables as their supertypes
- ➔ Technically, the process of specifying into which database table the items of a type are stored is called *deployment*
- ➔ Each Item type can have its own db table
 - ➔ specify deployment only for the first layer of *GenericItem* subtypes

1. hybris item definitions are found in each extension's *extensionName-items.xml*
2. The ant process assembles type definitions and generates Models, DTOs, and Resources.
3. hybris also creates the required tables.
4. Invoking initialize or update creates the required table.

1. What is the equivalent of a Java object in hybris?
2. What is the difference between a composed type and an atomic type in hybris?
3. What file is used to configure types in hybris?
4. In hybris, can you create new types, or only extend existing types?
5. Do you have to define a model-class in Java after defining it in xml?
6. Explain the notion of *deployment* in hybris.

1. Introduction to the Type System

Relations

Basically, there are two technically different ways of modeling collections in hybris:

→ CollectionTypes

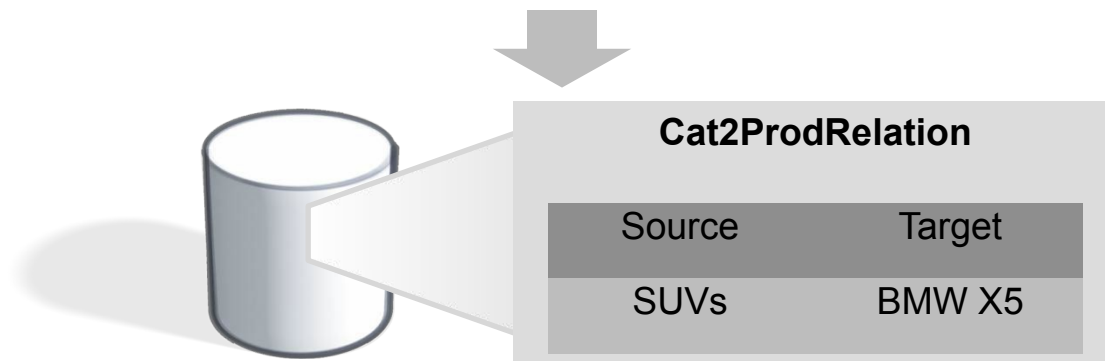

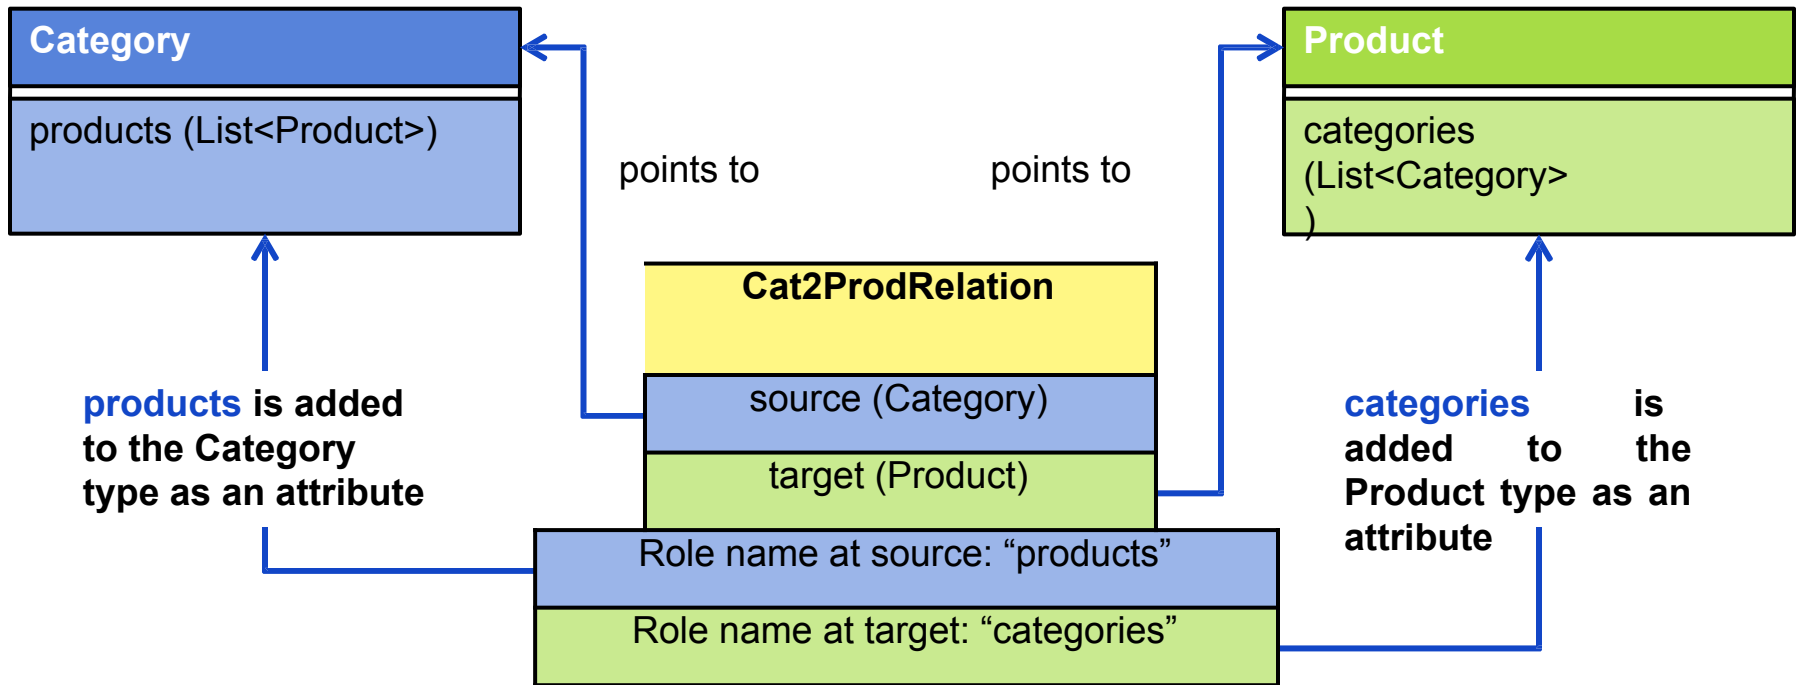

→ RelationTypes

→ Think of CollectionTypes in hybris as a backpack mounted onto a type

→ By runtime, CollectionTypes are resolved into a Collection of a kind of item, such as a List of MediaModels

→ On the database level, CollectionTypes are a comma-separated list of PKs

Enhanced flexibility:

- Create links between all kinds of types
- Create type-safe n-to-m relations:
 - Only link such elements of the source / target type declared at the relation

If in doubt: Use relations, do not use `CollectionTypes` because:

- Opposite side is not “aware” of the `CollectionType`
- `CollectionTypes` are stored in a database field as a comma-separated list of references (PKs)
- Can cause overflow, resulting in truncation and therefore loss of data
- More difficult to search and lower performance

Implicitly, relations are collections at source and target type, but ...

- Values for relations are stored in a separate database table
- Each value is stored in a separate table row

1. Name the two ways to model a collection in hybris
2. How are collection types stored in the database?
3. Specify some advantages and disadvantages of collection types
4. What is a relation in hybris?
