Surface anatomy of the brain

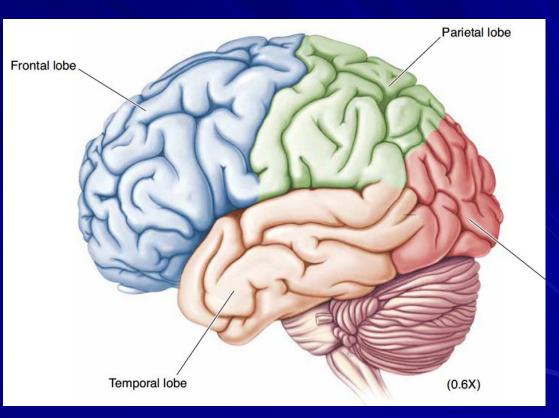

- The Lateral Surface of the Brain
- •The three major parts: 1.the large cerebrum 2.the brain stem 3.the cerebellum
- The small olfactory bulb of the cerebrum can also be seen in the lateral view.

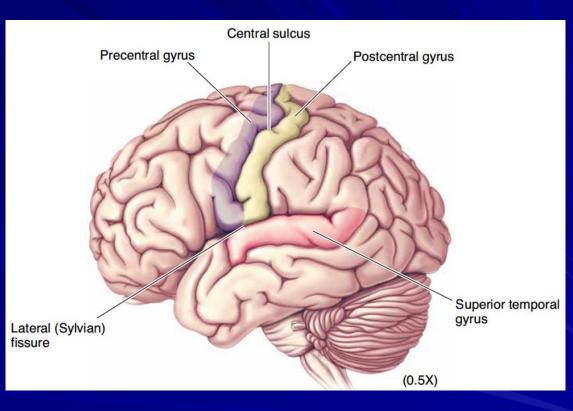

Cerebral Lobes and the Insula

- •The central sulcus divides the frontal lobe from the parietal lobe.
- •The temporal lobe lies immediately ventral to the deep lateral (Sylvian) fissure.
- •The occipital lobe lies at the very back of the cerebrum, bordering both parietal and temporal lobes.

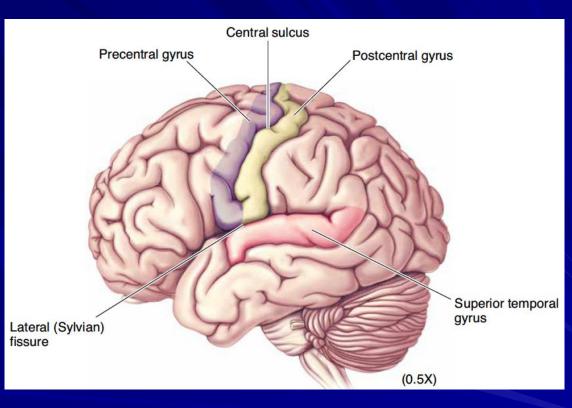

Selected Gyri, Sulci, and Fissures

- •The surface of the human cerebrum has the many convolutions.
- •The grooves in the surface are called sulci (singular: sulcus),
- •Especially deep grooves are called fissures
- •The bumps are called gyri (singular: gyrus).

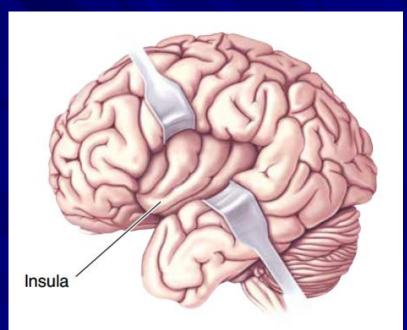

Selected Gyri, Sulci, and Fissures

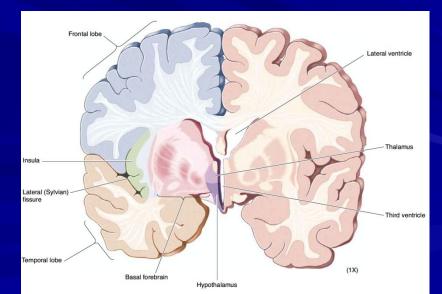

- •The postcentral gyrus lies immediately posterior to the central sulcus
- •The precentral gyrus lies immediately anterior to the central sulcus
- •The superior temporal gurus lies under the deep lateral (Sylvian) fissure

Cerebral Lobes and the Insula

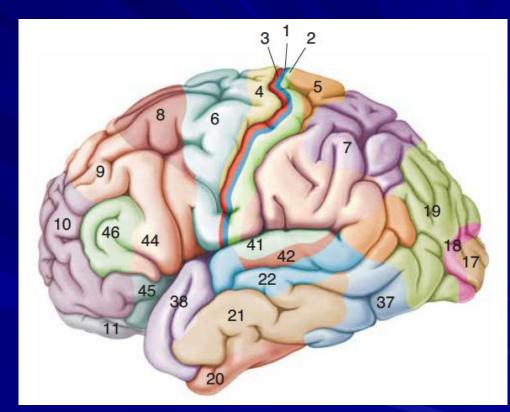

- •The insula is revealed if the margins of the lateral fissure are gently pulled apart.
- •The insula borders and separates the temporal and frontal lobes.

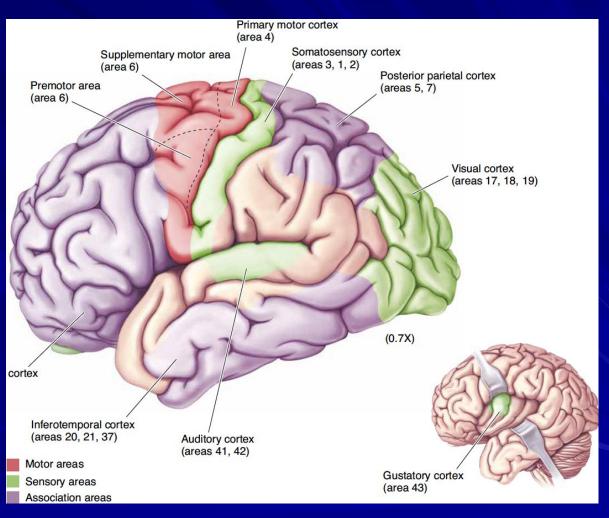

Major Sensory, Motor, and Association Areas of Cortex

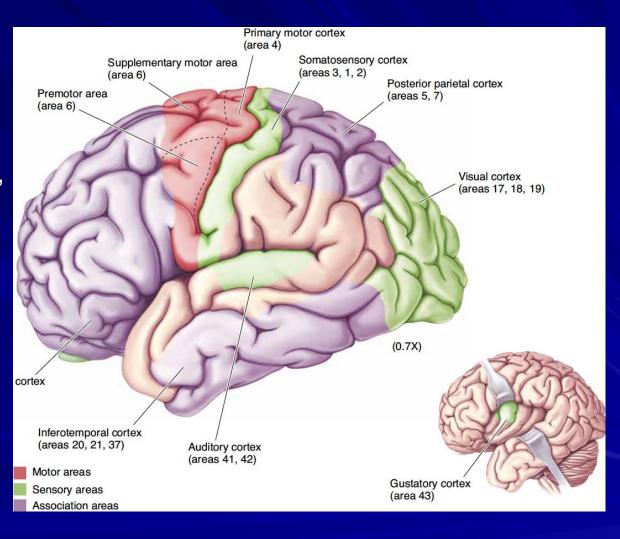

- •At the beginning of the twentieth century german neuroanatomist Brodmann constructed a cytoarchitectural map of the neocortex.
- •Each area of cortex having a common cytoarchitecture is given a number, for example, "area 17" at the tip of the occipital lobe, "area 4" just anterior to the central sulcus in the frontal lobe
- •The various areas differ from one another in terms of microscopic structure and function.

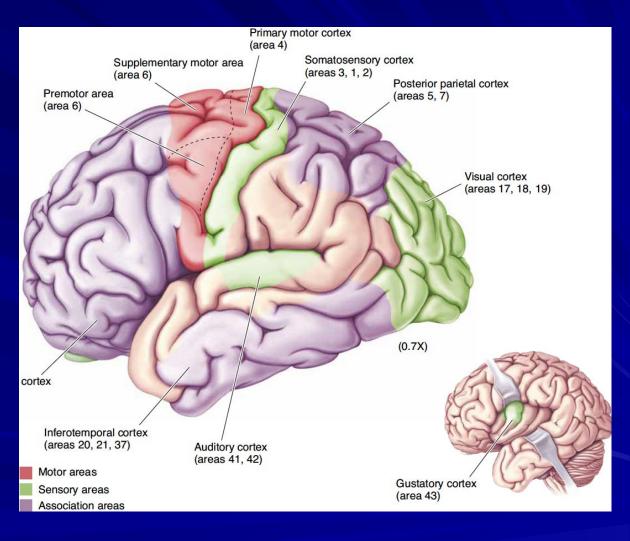

- Major Sensory, Motor, and Association Areas of Cortex
- Sensory areas
- •The visual areas are found in the occipital lobe
- •The somatic sensory areas are in the parietal lobe
- •The auditory areas are in the temporal lobe.
- •On the inferior surface of the parietal lobe and buried in the insula is the gustatory cortex, devoted to the sense of taste.

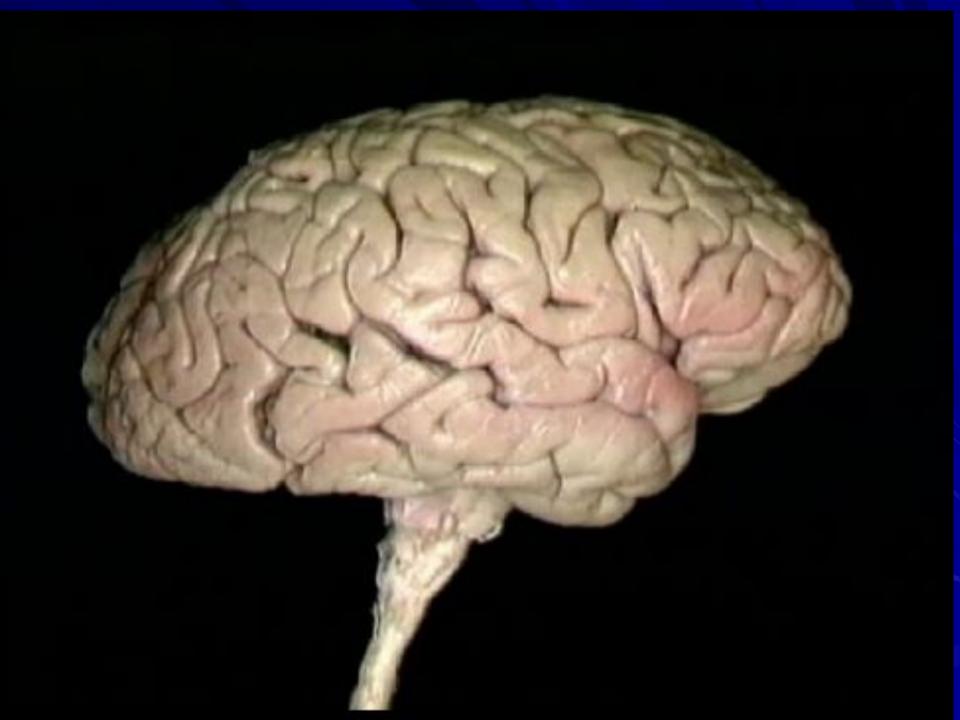

- Major Sensory, Motor, and Association Areas of Cortex
- Motor areas
- The major motor control areas lie in the frontal lobe, anterior to the central sulcus:
- 1. Primary motor cortex
- 2.Supplementary motor cortex
- 3.Premotor area

- Major Sensory, Motor, and Association Areas of Cortex
- The association areas Some of the more important areas are
- 1.the prefrontal cortex, the posterior
- 2.the posterior parietal cortex,
- 3.the inferotemporal cortex

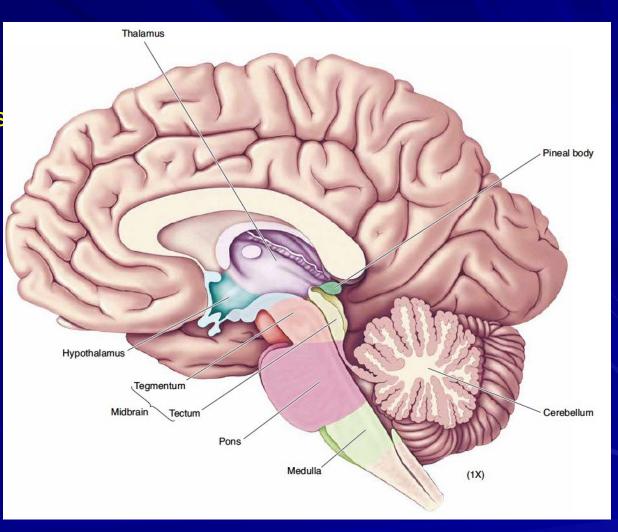

The Medial Surface of the Brain

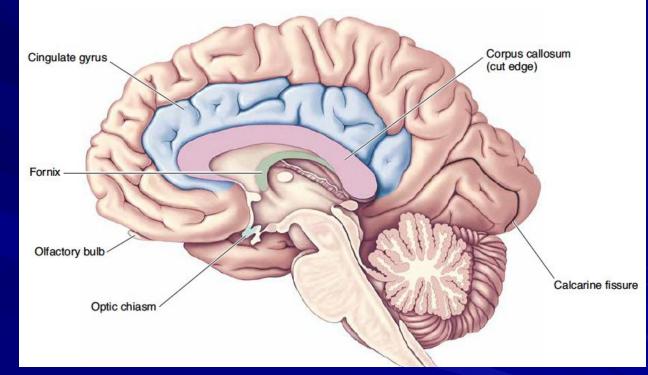

The brain stem consists of
1.the diencephalon (thalamus and hypothalamus),
2.the midbrain (tectum and tegmentum),
3.the pons,

4.the medulla.

Forebrain Structures

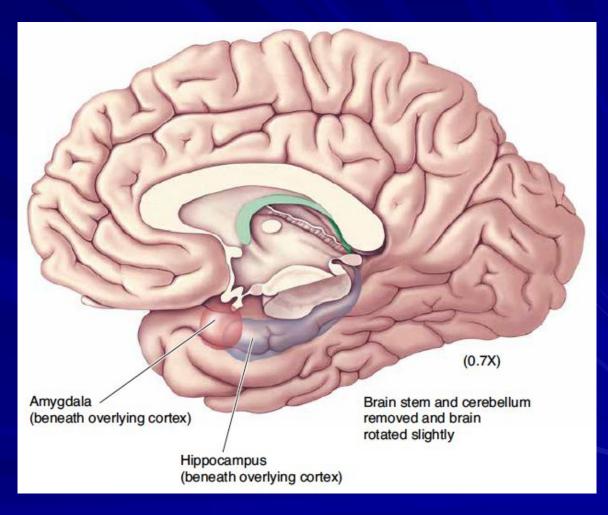

- 1.Corpus callosum (connects the two sides of the cerebrum)
- 2.Fornix (connects the hippocampus on each side with the hypothalamus)

Forebrain Structures

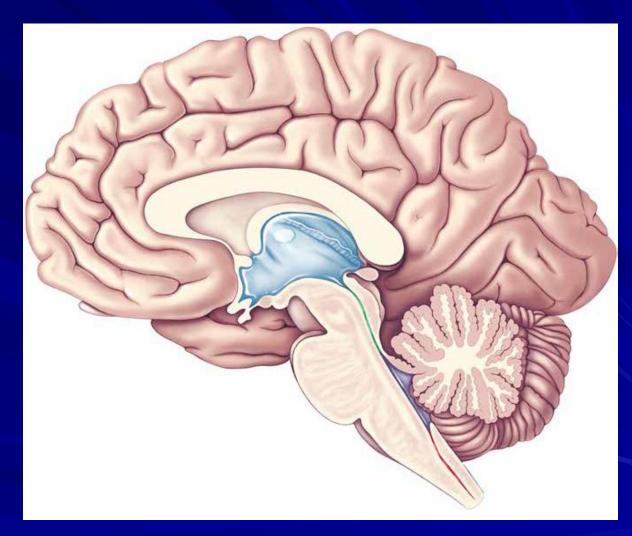

1.The amygdala is an important structure for regulating emotional states

2. The hippocampus is important for memory

Ventricles

1.the third ventricle
 2.the cerebral aqueduct
 3.the fourth ventricle
 4.the spinal canal

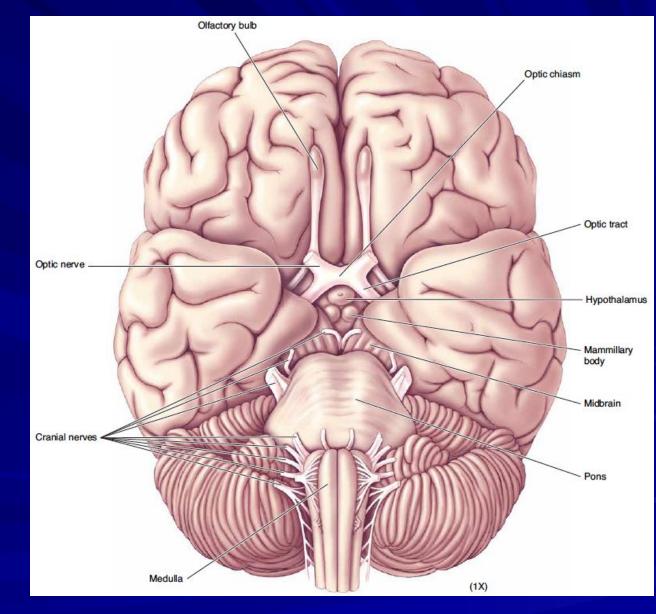

Ventricles

- •The lateral ventricles are paired structures that sprout like antlers from the third ventricle.
- •The two cerebral hemispheres surround the two lateral ventricles.

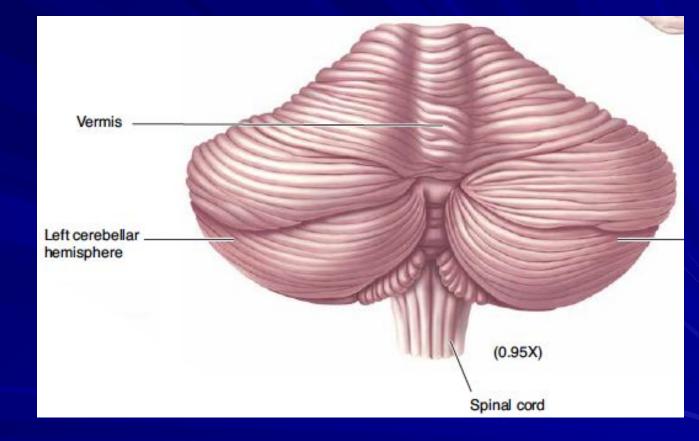

(0.7X) Lateral ventricle (beneath overlying cortex) Brain stem and cerebellum removed and brain rotated slightly

The Ventral Surface of the Brain

- the cranial nerves
- the optic chiasm
- the optic nerves
- •the optic tracts
- the paired mammillary bodies (part of the circuitry that stores memory)
- olfactory bulbs
- •the midbrain
- •pons
- •medulla

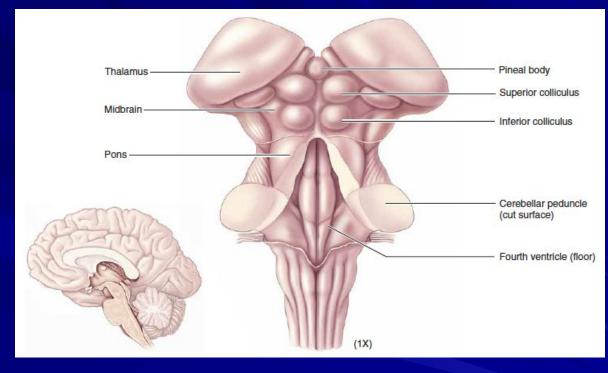

The cerebellumtwo hemispheresthe vermis (midline region)

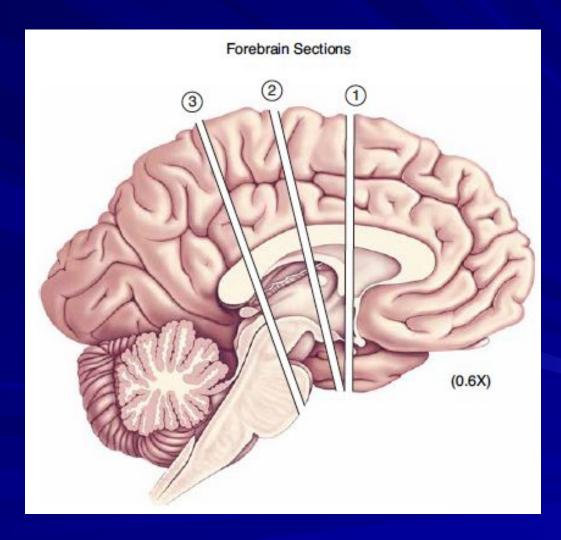

The brain stem

- •the pineal body (involved in the regulation of sleep and sexual behavior)
- •the superior colliculus (involved in the control of eye movements)
- •the inferior colliculus (important component of the auditory system)
- •the cerebellar peduncles (the large bundles of axons that connect the cerebellum and the brain stem)

Cross Section 1: Forebrain at Thalamus–Telencephalon Junction

Cross Section 1: Forebrain at Thalamus–Telencephal on Junction

(a) Gross Features

the lateral ventricles

•the third ventricle

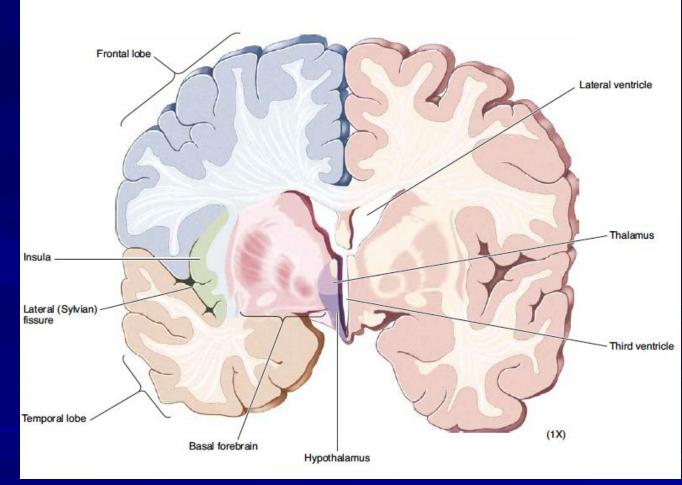

•the thalamus

•the hypothalamus (a vital control center for many basic bodily functions)

•the insula

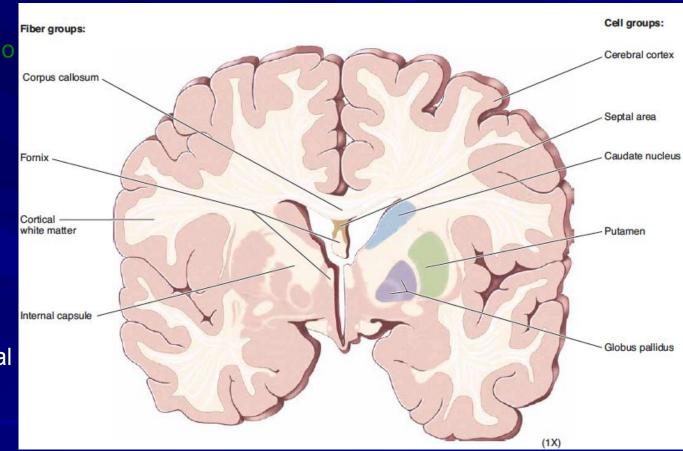

•the lateral (Sylvian) fissure

•the basal forebrain

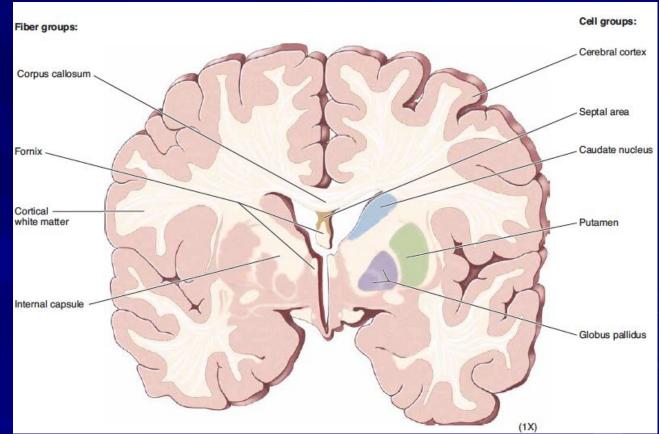

Cross Section 1: Forebrain at Thalamus–Telencephalo n Junction

- (b) Selected Fiber Groups
- 1.cortical white matter
- 2.internal capsule (connecting the cortical white matter with the brain stem)
- 3.corpus callosum (connecting the cerebral cortex of the two hemispheres)
- 4.fornix

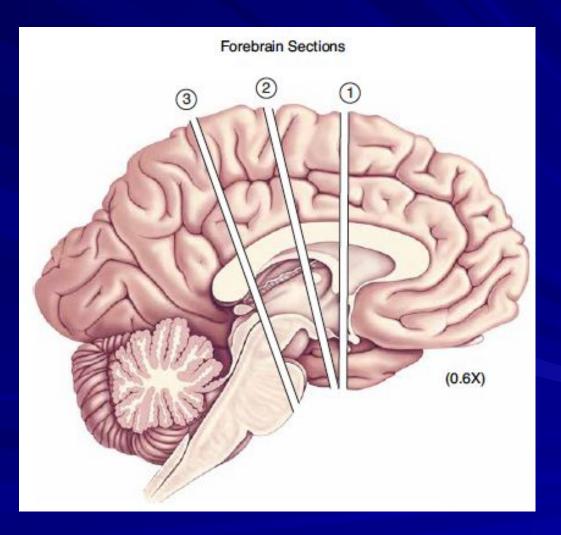

Cross Section 1: Forebrain at Thalamus–Telencephalo n Junction

- (b) Selected Cell Groups
 Basal ganglia (important part of the brain systems that control movement)
- 1.caudate nucleus
- 2.putamen
- 3.globus pallidus.
- •Septal area (contribute axons to the fornix and are involved in memory storage)

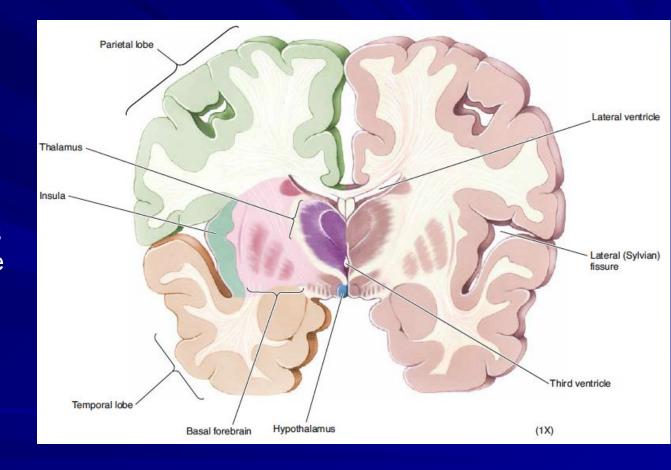

Cross Section 2: Forebrain at Mid-Thalamus

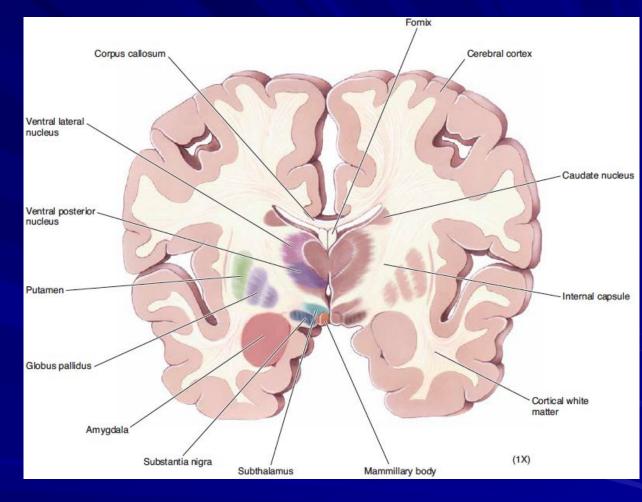

Cross Section 2: Forebrain at Mid-Thalamus

(a) Gross Features
As we move slightly caudal in the
thalamus
hypothalamus.
lateral fissure (separates the parietal lobe from the temporal lobe).

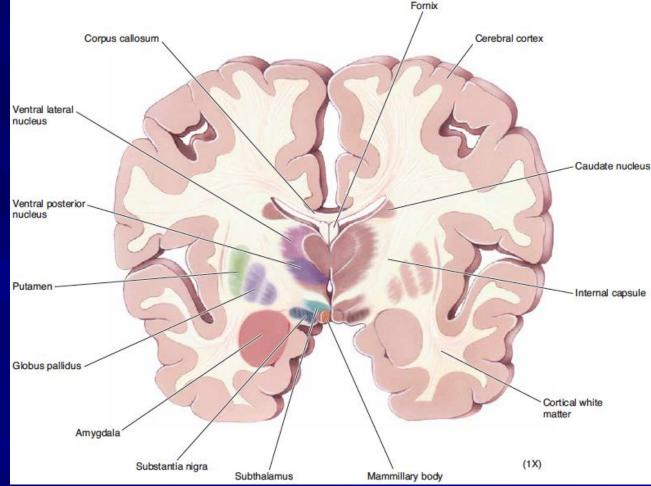

Cross Section 2: Forebrain at Mid-Thalamus

- (b) Selected Cell Groups.
- •the amygdala (involved in the regulation of emotion and memory)
- •The ventral posterior nucleus (part of the somatic sensory system and projects to the cortex of the postcentral gyrus).
- •The ventral lateral nucleus (parts of the motor system and project to the motor cortex of the precentral gyrus)

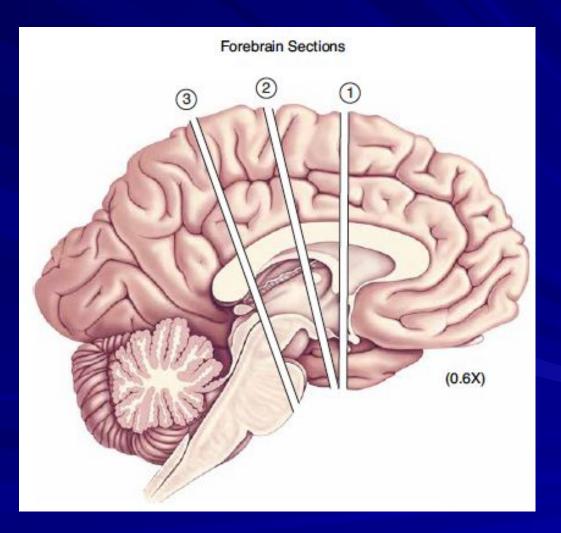

Cross Section 2: Forebrain at Mid-Thalamus

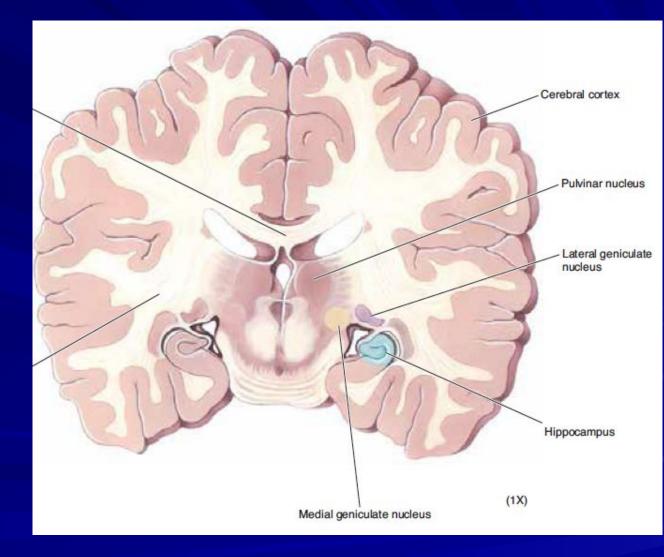

(b) Selected Cell Groups. •the subthalamus (part of the motor system) •the mammillary bodies (contribute to the regulation of memory) •the substantia nigra (part of the motor system. Parkinson's disease results from the degeneration of this structure)

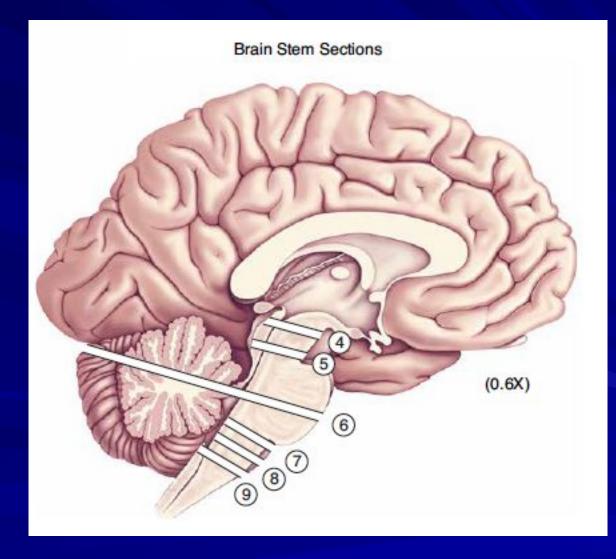

Cross Section 3: Forebrain at Thalamus–Midbrain Junction

- Cross Section 3: Forebrain at
- Thalamus–Midbrain Junction
- Selected Cell Groups
- •the pulvinar nucleus (plays a role in guiding attention)
- •the lateral geniculate nucleus (relays information to the visual cortex)
- the medial geniculate nucleus (relays information to the auditory cortex)
 the hippocampus (plays an important role in learning and memory)

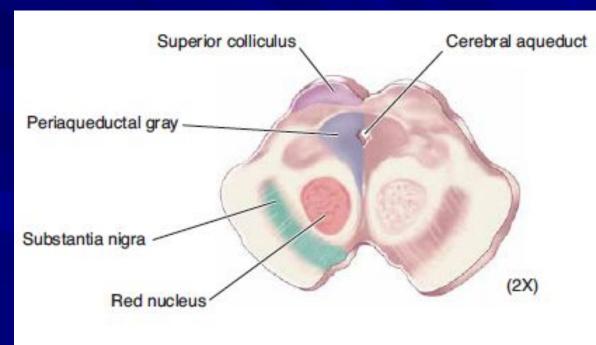

Cross Section 4: Rostral Midbrain

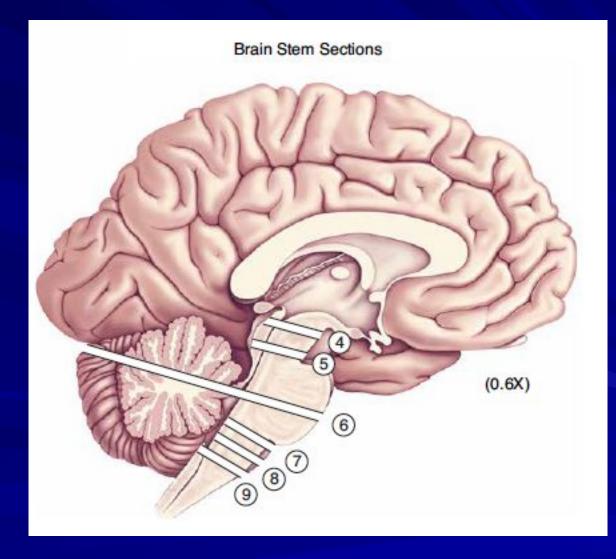

Cross Section 4: Rostral Midbrain

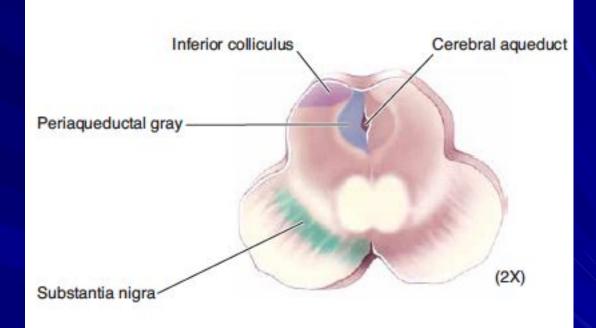

- •the cerebral aqueduct
- •the tectum (consists of the paired superior colliculus)
- •the substantia nigra (part of the motor system)
- •the red nucleus (motor control structure)
- •the periaqueductal gray (important in the control of the somatic pain sensations)

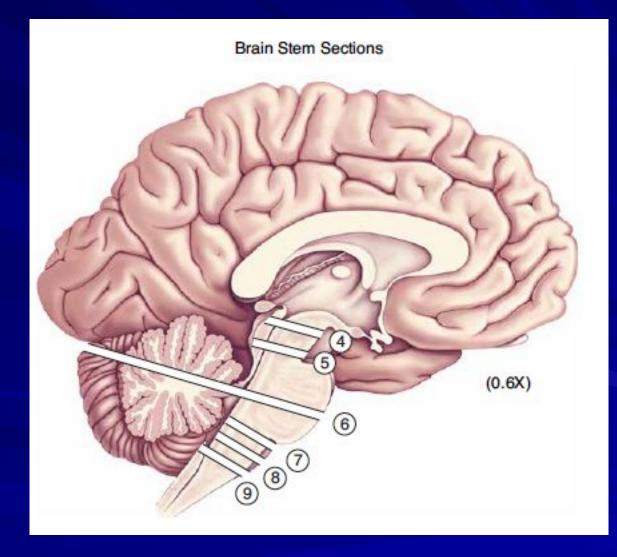

Cross Section 5: Caudal Midbrain

- Cross Section 4: Caudal Midbrain
- the cerebral aqueduct
 the tectum (consists of the paired inferior colliculus)
 the substantia nigra
 periaqueductal gray

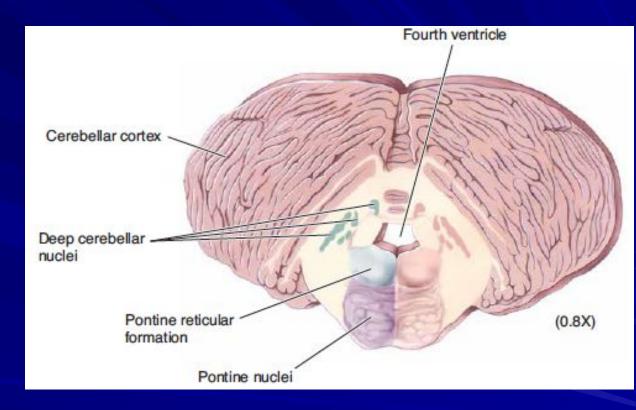

Cross Section 6: Pons and Cerebellum

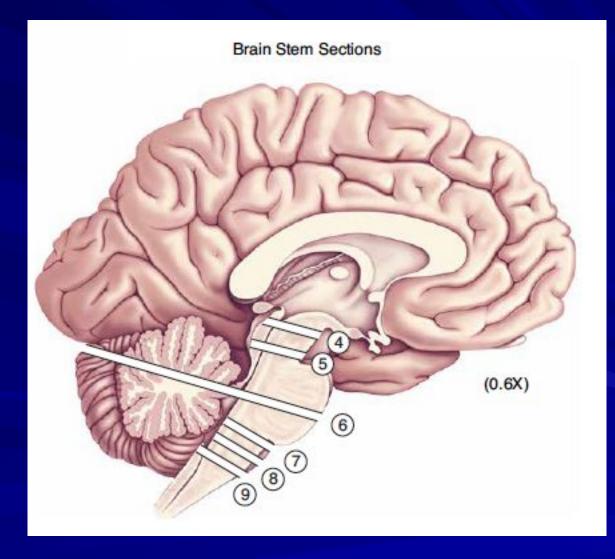

Cross Section 6: Pons and Cerebellum

pontine nuclei (the input to the cerebellar cortex)
deep cerebellar nuclei (the output of the cerebellum).
reticular formation (regulate sleep and wakefulness, control body posture)

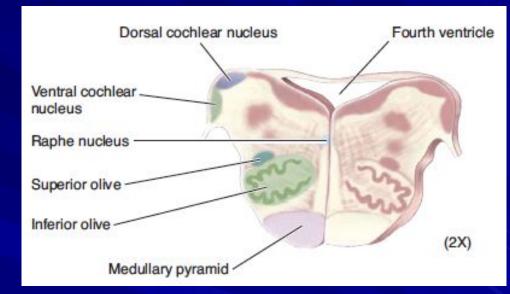

Cross Section 7: Rostral Medulla

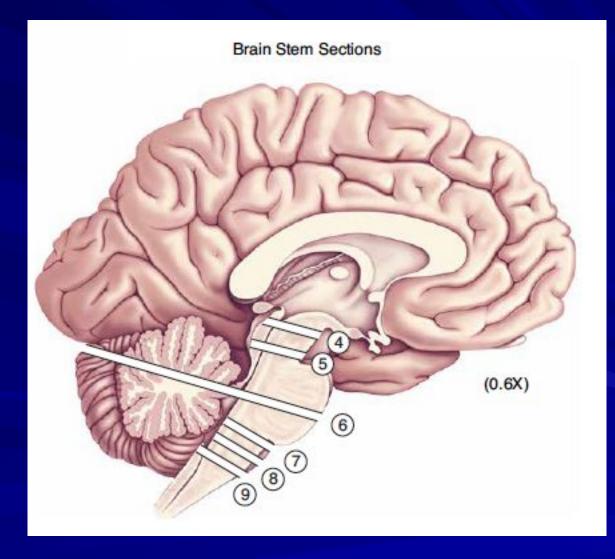

Cross Section 7: Rostral Medulla

•Medullary pyramids (contain the corticospinal tracts, which are involved in the control of voluntary movement)

- •Several nuclei that are important for hearing:
- 1.dorsal cochlear nuclei
- 2.ventral cochlear nuclei
- 3. superior olive
- Inferior olive (important for motor control)
- •Raphe nucleus (important for the modulation of pain, mood, and wakefulness)

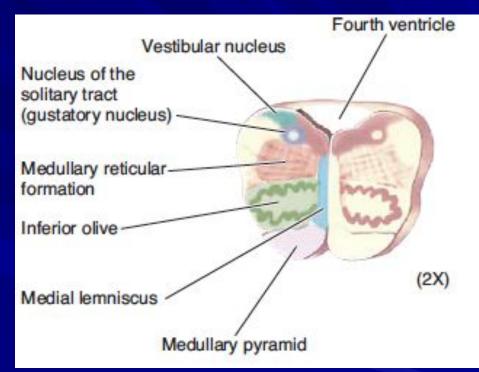

Cross Section 8: Mid-Medulla

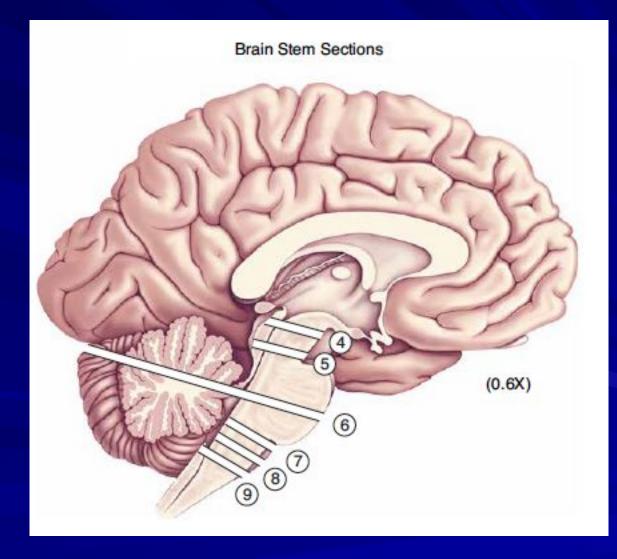

Cross Section 8: Mid-Medulla

- •The medial lemniscus (contains axons bringing information about somatic sensation to the thalamus).
- •The gustatory nucleus (part of the larger solitary nucleus, serves the sense of taste).
- •The vestibular nuclei (serve the sense of balance).

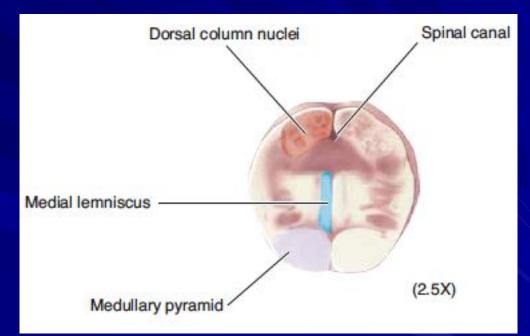

Cross Section 9: Medulla–Spinal Cord Junction

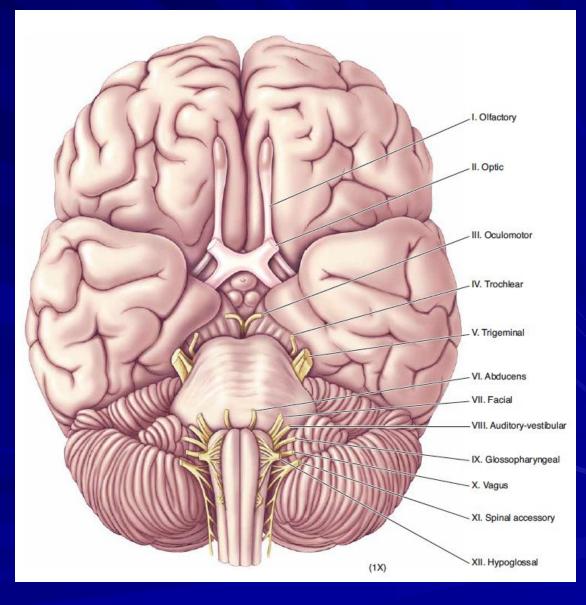

Cross Section 9: Medulla–Spinal Cord Junction

- •the dorsal column nuclei (receive somatic sensory information from the spinal cord)
- •Axons arising from the neurons in each dorsal column nucleus cross to the other side of the brain and ascend to the thalamus via the medial lemniscus.

The cranial nerves

- Twelve pairs of cranial nerves emerge from the base of the brain.
- Single nerve often has fibers performing many different functions.
- The first two "nerves" are parts of the CNS, serving olfaction and vision.
- The cranial nerves have associated cranial nerve nuclei in the midbrain, pons, and medulla

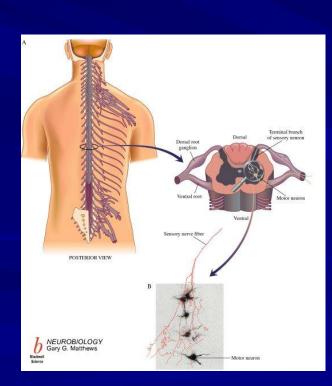

The cranial nerves

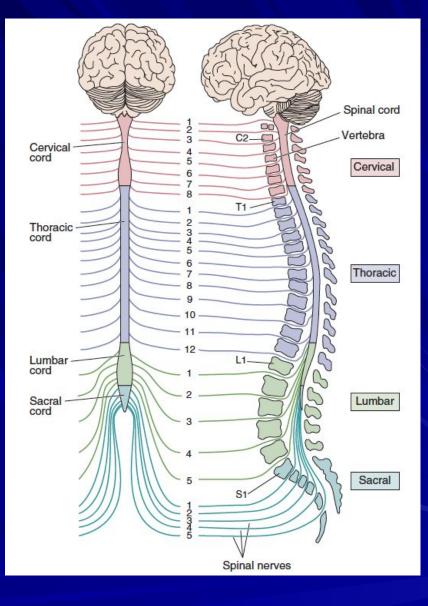

NERVE NUMBER AND NAME	TYPES OF AXONS	IMPORTANT FUNCTIONS
I. Olfactory	Special sensory	Sensation of smell
II. Optic	Special sensory	Sensation of vision
III. Oculomotor	Somatic motor	Movements of the eye and eyelid
	Visceral motor	Parasympathetic control of pupil size
IV. Trochlear	Somatic motor	Movements of the eye
V. Trigeminal	Somatic sensory	Sensation of touch to the face
	Somatic motor	Movement of muscles of mastication (chewing)
VI. Abducens	Somatic motor	Movements of the eye
VII. Facial	Somatic sensory	Movement of muscles of facial expression
	Special sensory	Sensation of taste in anterior two-thirds of the tongue
VIII. Auditory-vestibular	Special sensory	Sensation of hearing and balance
IX. Glossopharyngeal	Somatic motor	Movement of muscles in the throat (oropharynx)
	Visceral motor	Parasympathetic control of the salivary glands
	Special sensory	Sensation of taste in posterior one-third of the tongue
	Visceral sensory	Detection of blood pressure changes in the aorta
X. Vagus	Visceral motor	Parasympathetic control of the heart, lungs, and abdominal organs
	Visceral sensory	Sensation of pain associated with viscera
	Somatic motor	Movement of muscles in the throat (oropharynx)
XI. Spinal accessory	Somatic motor	Movement of muscles in the throat and neck
XII. Hypoglossal	Somatic motor	Movement of the tongue

Gross Anatomy

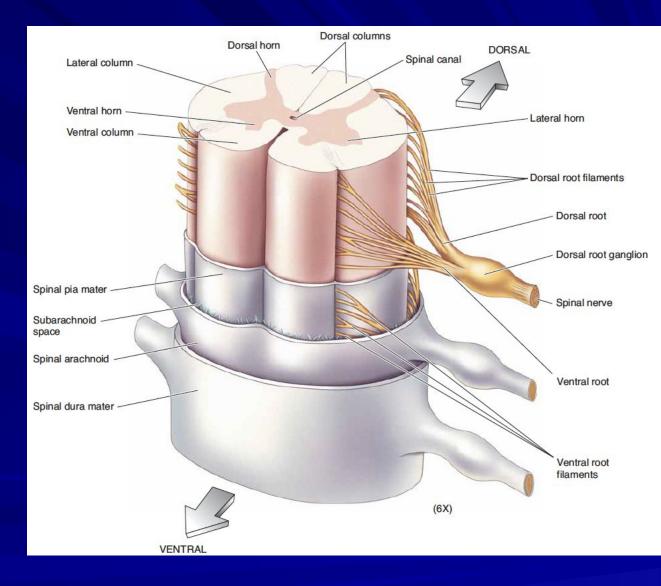

- •The spinal cord is located within the vertebral canal
- The spinal cord has 31 pairs of spinal nerves
 The spinal cord consists of 31 segments
- 1.cervical 8
- 2.thoracic 12
- 3.**lumbar 5**
- 4.sacral 5
- 5.coccygeal -1

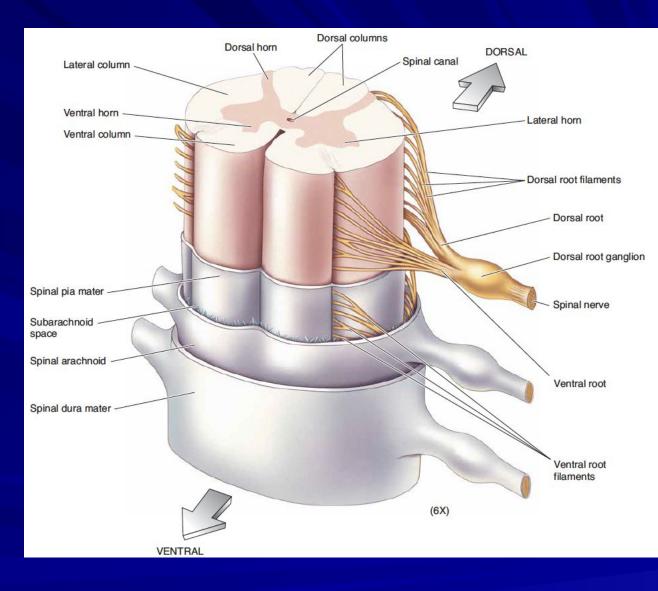

The Ventral–Lateral Surface

- •The nerve splits into two roots.
- The dorsal root carries sensory axons
 Cell bodies of sensory axons lie in the dorsal root ganglia.
- •The ventral root carries motor axons arising from the gray matter of the ventral spinal cord.

The Ventral–Lateral Surface

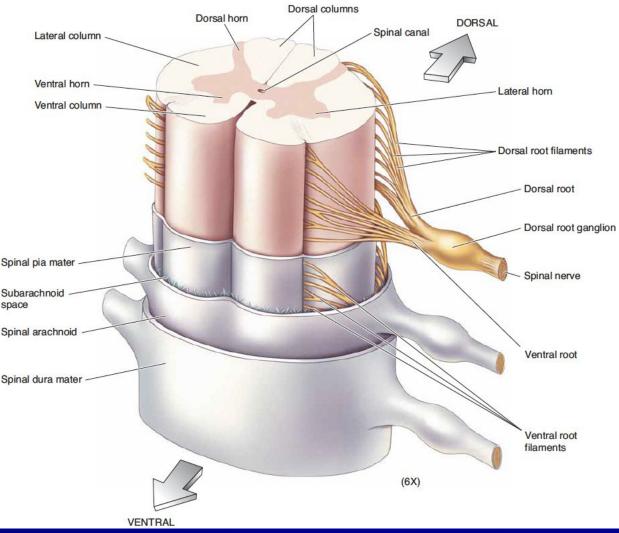

- •The butterfly-shaped core of the spinal cord is gray matter, consisting of neuronal cell bodies.
- •The gray matter is divided into
- 1.the dorsal horns
- 2.lateral horns
- 3.ventral horns

The Ventral–Lateral Surface

•The white matter contains the long axons that run up and down the cord

- •The white matter is divided into three columns:
- 1.the dorsal columns 2.the lateral columns
- Spinal arachnoid 3.the ventral columns Spinal dura mater

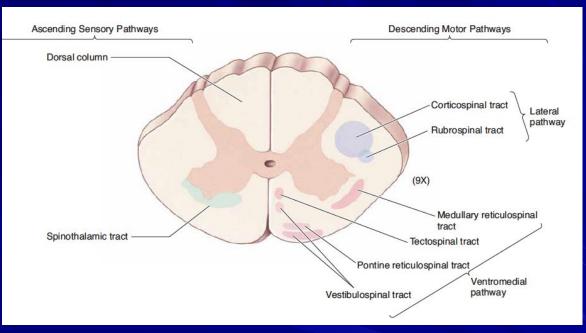

Cross-Sectional Anatomy

The white mutter consists of

- 1.the ascending sensory pathways
- 2.the descending motor pathways

Ascending sensory pathways

- •The entire dorsal column consists of sensory axons ascending to the brain.
- •This pathway is important for touch sensation.
- •The spinothalamic tract carries information about painful stimuli and temperature.

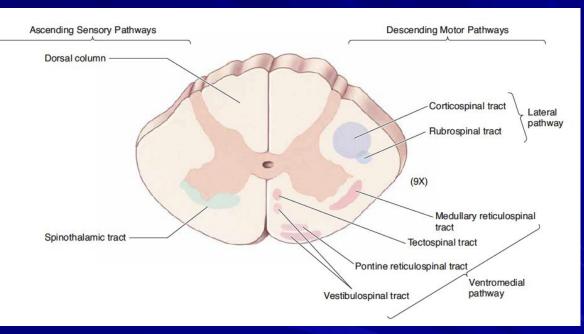

Cross-Sectional Anatomy

Descending motor pathways

The descending tracts contribute to two pathways:
1.the lateral pathways
2.the ventromedial pathways.

•The lateral pathway carries the commands for voluntary movements

•The ventromedial pathway participates mainly in the maintenance of posture and certain reflex movements.
