

**Studying new products, marketing consultant is faced with four alternative factory marks, five possible packaging designs and with three variants of the advertising company.**

- A. What number of strategies should consider the management of the firm?**
- B. B. What is the state of the economy and what impact it may have on the choice of a management company?**

**Explain how indicators of dispersion such as swing (amplitude), root-mean-square deviation, can be used to indicate the degree of risk in decision making. How the constant of variation is used?**

**Most entrepreneurs are risk-averse.**

**Why?**

**What are the factors affecting the function of the risk-profit of the decision-makers?**

**Under what circumstances the expected value is not enough to get the solution?**

**What other measurements could we use?**

After receiving a bachelor degree Masha got a great position in the international accounting firm. In the first year of employment Masha was able to save \$ 6,000 which she placed in a money market Fund. Currently she is studying two investment opportunities.

For the project A the probability of profit with the net present value of \$ 3000 equals to 0.20, the probability of profit with the net present value of \$ 10,000 is 0.10 and the probability of profit with the net present value of \$ 7000. equals to 0.70. For a project B the probability of profit with the net present value of \$ 4,000 equals to 0.35, the probability of profit with the net present value of \$ 6500 equals to 0.40 and the probability of profit with the net present value of \$ 8000 equals to 0.25.

- A. What is the estimated current value for each investment?
- B. Find the root-mean-square deviation and coefficient of variation for each investment. What investments should be selected?
- C. Assume that the total utility of income can be expressed by the equation  
$$TU = 25X - 3 X^2$$
, where  $X$  is expressed in thousands of dollars. What investments should be selected? Why?

**Explain why the method of the certainty equivalent is considered more preferable than the method of discount rate, adjusted for risk.**

Suppose that the firm has an opportunity to invest in two different projects. Using the matrix, find the expected value of future returns, root-mean square deviations. Using the coefficient of variation, specify which investments are more risky, and explain why.

Project		Possibilities			

**Summarize the logical sequence of steps necessary for making decisions in conditions of risk.**

The prices of steel products over the past 11 months according to the statistics :

<b>Month</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>
<b>Price</b>	<b>300</b>	<b>310</b>	<b>312</b>	<b>309</b>	<b>302</b>	<b>305</b>
<b>Month</b>	<b>7</b>	<b>8</b>	<b>9</b>	<b>10</b>	<b>11</b>	<b>12</b>
<b>Prise</b>	<b>304</b>	<b>300</b>	<b>298</b>	<b>305</b>	<b>304</b>	

What is the probability of the next month the price will decrease compared to its last value?

What is the probability of the next month the price will have a value of less than \$ 304?

**You are given data about 3 investment projects.  
Identify the least risky project.**

<b>Project</b>	<b>Profit</b>	<b>Number of cases, n</b>	<b>Total number of cases, N</b>	<b>Probability, Pi</b>
<b>A</b>	15	7	30	
	30	11	30	
	35	6	30	
	-20	4	30	
	-40	2	30	
<b>Б</b>	65			0.2
	45			0.4
	20			0.1
	-15			0.2
	-25			0.1
<b>B</b>	50	10	60	
	30	15	60	
	15	20	60	
	-10	10	60	
	-20	5	60	

**On the basis of calculations for the project the following values were obtained :**

- **NPV = 3900 rubles.;**
- **IRR = 30%;**
- **DPP = 4.5 years.**

**During the stress test and variables modification influencing the project were obtained new values**

<b>Variables</b>	<b>Variables modification</b>	<b>NPV</b>	<b>IRR</b>	<b>DPP</b>
<b>%</b>	<b>10%</b>	<b>3500</b>	<b>25</b>	<b>4,7</b>
<b>FC</b>	<b>8%</b>	<b>3850</b>	<b>21</b>	<b>4,9</b>
<b>Residual value</b>	<b>5%</b>	<b>3800</b>	<b>28</b>	<b>5,3</b>
<b>VC</b>	<b>4%</b>	<b>3400</b>	<b>23</b>	<b>5,1</b>
<b>Sales volume</b>	<b>6%</b>	<b>3100</b>	<b>26</b>	<b>4,6</b>
<b>Price</b>	<b>7%</b>	<b>2600</b>	<b>22</b>	<b>5,2</b>

**Conduct a sensitivity analysis of the project according to the criterion of NPV and on the basis of calculations build the rose (star) of project risks.**
