

Red wolf

Critically Endangered species of wolf

The red wolf is a fairly large animal with a body length of 55-110 cm, a tail length of 45-50 cm and a weight of 17-21 kg.

His appearance combines the features of a wolf, a fox and a jackal. It differs from an ordinary wolf in color, fluffy fur and a longer tail.

The red wolf was distributed from the Tien Shan and Altai south to the tip of Hindustan, Indochina and the Malay archipelago. The main part of its range falls on the mountain-forest regions of Central and South Asia.

Measures to save the red wolf are
being taken on an international
scale

It is necessary to identify areas where the red wolf still appears. There should be a large warning among the population to prevent accidental shooting of the red wolf.
