Astana 2017

E-mail From one person to another, information has been generated from the time of the first community building. From the very beginning, when people transmitted important information through voice, then the human voice was only heard in the near future, giving the information a drum. The first people used fire and smoke to mark the second place in one place.

The first mailbox appeared in Florence in the 16th century. It was made of wood and was called "tambur".

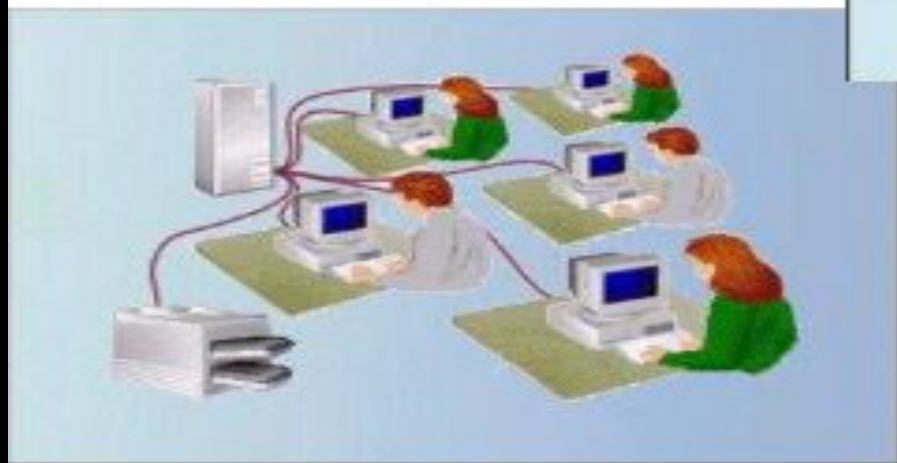

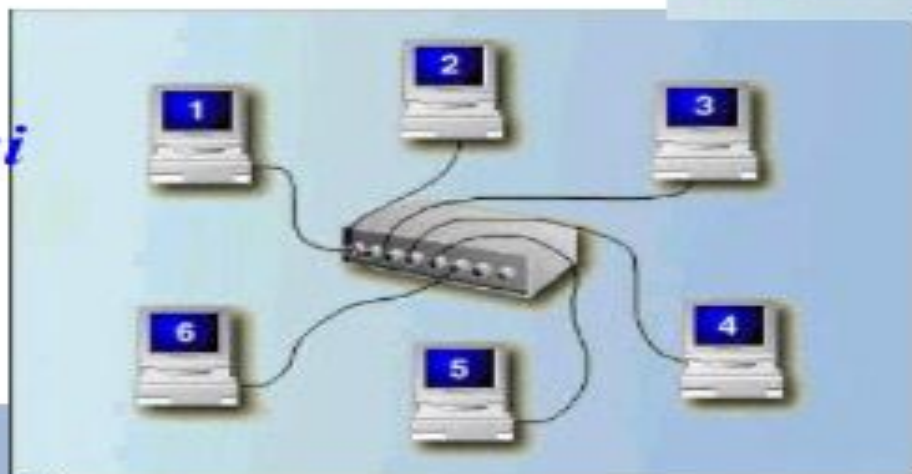

E-mail In 1820, Brayer, a paper trader in Brighton, invented a usual envelope. In Kazakhstan, the official post office was opened in 1860 in Almaty (Vernyi).

Email protocols

IMAP and POP3 protocols are the most common protocols used to retrieve e-mail messages in an email client application. The Internet Message Access Protocol (IMAP) is another 'Internet Protocol' for e-mail retrieval. IMAP has some advantages over the POP3 protocol, for example, multiple clients can connect to the same mailbox at the same time and store message status information, such as whether a message is read, replied, or deleted. ESET Smart Security will provide protection for these protocols, regardless of the e-mail client used and without needing to re-configure your e-mail client.

THE END

THANK YOU FOR YOUR ATTENTION!
