## LECTURE 10 REGRESSION AND TIME SERIES

Saidgozi Saydumarov<br>Sherzodbek Safarov<br>QM Module Leaders<br>ssaydumarov@wiut.uz<br>s.safarov@wiut.uz

Office hours: by appointment An Accredited Institution of the University of Westminster (UK)
-Quick review of regression
-Simple linear regression as conditional mean
-Using regression for estimation
-Using regression for trend in time series

## Quick review

Regression is a technique for determining the statistical relationship between two or more variables where a change in a dependent variable is associated with, and depends on, a change in one or more independent variables.

$$
y=\alpha+\beta x+\epsilon
$$

To calculate coefficients of the regression equation, we need to find the descriptive statistics (average, standard deviation, covariance) of the data first.

Regression example: Student mark vs absence
The following data about the average mark for a student and the number of hours the student was absent was collected from a group of 24 students.

We would like to see whether the number of hours a student was absent affects the marks that a student gets.

| Student <br> mark | Number of <br> hours <br> absent | Student <br> mark | Number of <br> hours <br> absent |
| :---: | :---: | :---: | :---: |
| 61 | 2 | 53 | 4 |
| 56 | 3 | 67 | 1 |
| 74 | 0 | 58 | 3 |
| 57 | 4 | 65 | 1 |
| 65 | 0 | 25 | 12 |
| 75 | 0 | 67 | 2 |
| 73 | 0 | 74 | 0 |
| 75 | 0 | 73 | 0 |
| 70 | 1 | 70 | 1 |
| 68 | 0 | 63 | 1 |
| 42 | 7 | 50 | 5 |
| 67 | 0 | 62 | 3 |

Regression example: Student mark vs absence
Average
Student mark: 62.9
Hours absent per week: 2.1
Standard deviation
Student mark: 11.8
Hours absent per week: 2.8
Covariance: -32.3

| Student mark | Number of <br> hours absent | Student mark | Number of <br> hours absent |
| :---: | :---: | :---: | :---: |
| 61 | 2 | 53 | 4 |
| 56 | 3 | 67 | 1 |
| 74 | 0 | 58 | 3 |
| 57 | 4 | 65 | 1 |
| 65 | 0 | 25 | 12 |
| 75 | 0 | 67 | 2 |
| 73 | 0 | 74 | 0 |
| 75 | 0 | 73 | 0 |
| 70 | 1 | 70 | 1 |
| 68 | 0 | 63 | 1 |
| 42 | 7 | 50 | 5 |
| 67 | 0 | 62 | 3 |

## Regression as conditional mean

What is the average mark of students that were never absent?

One approach is to calculate the mean from the sample of students:
$=\frac{74+65+75+73+75+68+67+74+73}{9}=71.5$

But since we estimated the regression equation, we can use that too:

$$
\text { Student mark }=\alpha+\beta * 0=71.2
$$

| Student <br> mark | Number of <br> hours absent | Student <br> mark | Number of <br> hours absent |
| :---: | :---: | :---: | :---: |
| 61 | 2 | 53 | 4 |
| 56 | 3 | 67 | 1 |
| 74 | 0 | 58 | 3 |
| 57 | 4 | 65 | 1 |
| 65 | 0 | 25 | 12 |
| 75 | 0 | 67 | 2 |
| 73 | 0 | 74 | 0 |
| 75 | 0 | 73 | 0 |
| 70 | 1 | 70 | 1 |
| 68 | 0 | 63 | 1 |
| 42 | 7 | 50 | 5 |
| 67 | 0 | 62 | 3 |

So we could say:
Average student mark $=71.2-4 *$ Average hours absent

## Regression as conditional mean

What is the average mark of students that were absent for an hour on average?

We can calculate it from the sample data directly:

$$
=\frac{70+65+67+70+63}{5}=67
$$

Or we can use the regression equation:

$$
\text { Student mark }=\alpha+\beta * 1=71.2-4 * 1=67.2
$$

The regression equation gives the mean conditional on a

| Student <br> mark | Number of <br> hours absent | Student <br> mark | Number of <br> hours absent |
| :---: | :---: | :---: | :---: |
| 61 | 2 | 53 | 4 |
| 56 | 3 | 67 | 1 |
| 74 | 0 | 58 | 3 |
| 57 | 4 | 65 | 1 |
| 65 | 0 | 25 | 12 |
| 75 | 0 | 67 | 2 |
| 73 | 0 | 74 | 0 |
| 75 | 0 | 73 | 0 |
| 70 | 1 | 70 | 1 |
| 68 | 0 | 63 | 1 |
| 42 | 7 | 50 | 5 |
| 67 | 0 | 62 | 3 | value for X . Here, it is the number of hours absent.

What is the average mark of students that were absent for 10 hours on average?

Note that we do not have any observations for a student who was absent for 10 hours.

But we can use the regression equation:
Avg student mark $=71.2-4 * 10=31.2$

| Student <br> mark | Number of <br> hours absent | Student <br> mark | Number of <br> hours absent |
| :---: | :---: | :---: | :---: |
| 61 | 2 | 53 | 4 |
| 56 | 3 | 67 | 1 |
| 74 | 0 | 58 | 3 |
| 57 | 4 | 65 | 1 |
| 65 | 0 | 25 | 12 |
| 75 | 0 | 67 | 2 |
| 73 | 0 | 74 | 0 |
| 75 | 0 | 73 | 0 |
| 70 | 1 | 70 | 1 |
| 68 | 0 | 63 | 1 |
| 42 | 7 | 50 | 5 |
| 67 | 0 | 62 | 3 |

## Using regression for estimation

Similarly, we can find the conditional mean for any number of hours absent:

Hours absent $=7$
Average mark $=71.2-4 * 7=43.2$

We can even estimate the student mark for number of hours absent outside the range of our data. For example:

Hours absent $=15$
Average mark $=71.2-4 * 15=11.2$

| Student <br> mark | Number of <br> hours absent | Student <br> mark | Number of <br> hours absent |
| :---: | :---: | :---: | :---: |
| 61 | 2 | 53 | 4 |
| 56 | 3 | 67 | 1 |
| 74 | 0 | 58 | 3 |
| 57 | 4 | 65 | 1 |
| 65 | 0 | 25 | 12 |
| 75 | 0 | 67 | 2 |
| 73 | 0 | 74 | 0 |
| 75 | 0 | 73 | 0 |
| 70 | 1 | 70 | 1 |
| 68 | 0 | 63 | 1 |
| 42 | 7 | 50 | 5 |
| 67 | 0 | 62 | 3 |
|  |  |  |  |

However, caution must be taken when estimating using out of sample ranges.
What happens when $X=18$ ?

## Using regression for trend line

In the previous week, we looked at forecasting time series data.
That included calculating the Centered Moving Average to get the trend component:

| Year | Quarter | Number of <br> visitors | CMA |
| :---: | :---: | :---: | :---: |
| 2013 | I | 8,604 |  |
|  | II | 6,556 |  |
|  | III | 3,824 | 7,365 |
|  | IV | 9,462 | 7,832 |
|  | I | 10,628 | 8,179 |
| 2014 | II | 8,275 | 8,511 |
|  | III | 4,881 |  |
|  | IV | 11,054 |  |

## Using regression for trend line

Since the trend is the long term changes in the data, it needs to be smooth and straight as possible. The regression equation suits this purpose very well.

Trend $=\alpha+\beta *$ time

| Time | CMA |
| :---: | :---: |
| 1 |  |
| 2 |  |
| 3 | 7,365 |
| 4 | 7,832 |
| 5 | 8,179 |
| 6 | 8,511 |
| 7 |  |
| 8 |  |

## Using regression for trend line

$$
\text { Trend }=\alpha+\beta * \text { time }
$$

Average

$$
\begin{aligned}
& \text { Time }=4.5 \\
& \text { Trend }=7,972
\end{aligned}
$$

| Time | CMA <br> (trend) | Time $^{2}$ | Trend*Time |
| :---: | :---: | :---: | :---: |
| 1 |  |  |  |
| 2 |  |  |  |
| 3 | 7,365 | 9 | 22,094 |
| 4 | 7,832 | 16 | 31,330 |
| 5 | 8,179 | 25 | 40,897 |
| 6 | 8,511 | 36 | 51,063 |
| 7 |  |  |  |
| 8 |  | 86 | 145,383 |
| SUM |  |  |  |

Alpha

$$
=473.1 / 1.25=378.5
$$

Variance
Time $=86 / 4-4.5^{2}=1.25$
Covariance

$$
=145,383 / 4-4.5^{*} 7,972=473.1
$$

Beta

$$
=7,972-378.5 * 4.5=6,268.4
$$

## Using regression for trend line

Forecasting the trend component for Q1 2015:
Time $=9$

$$
\begin{aligned}
\text { Trend }= & 6,268.4+378.5 * 9 \\
& =9674.9
\end{aligned}
$$

| Year | Quarter | Time | Number <br> of visitors | CMA |
| :---: | :---: | :---: | :---: | :---: |
| 2013 | I | 1 | 8,604 |  |
|  | II | 2 | 6,556 |  |
|  | III | 3 | 3,824 | 7,365 |
|  | IV | 4 | 9,462 | 7,832 |
|  | I | 5 | 10,628 | 8,179 |
|  | II | 6 | 8,275 | 8,511 |
|  | III | 7 | 4,881 |  |
|  | IV | 8 | 11,054 |  |
