A decorative graphic on the left side of the slide, consisting of a network of light blue lines and circles of varying sizes, resembling a circuit board or a neural network diagram.

Larry Zottarelli, the last original Voyager engineer still on the project, is retiring. While there are still a few hands around who worked on the original project, now the job of keeping this now-interstellar spacecraft going will fall to someone else. And that someone needs to have some very specific skills.

Yes, it's going to require coding, but it won't be in Ruby on Rails or Python. Not C or C++. Go a little further back, to the assembly languages used in early computing. Can you breeze through Fortran? Then you might be the person for the job.

**YOU HAVE A FEW TASKS AHEAD OF YOU AND ABOUT 64 KILOBYTES OF
MEMORY TO WORK WITH**

The stakes are especially high for the financial industry, where an estimated \$3 trillion in daily commerce flows through COBOL systems. The language underpins deposit accounts, check-clearing services, card networks, ATMs, mortgage servicing, loan ledgers and other services.

The industry's aggressive push into digital banking makes it even more important to solve the COBOL dilemma. Mobile apps and other new tools are written in modern languages that need to work seamlessly with old underlying systems.

That is where COBOL specialists come in.

A decorative graphic on the left side of the slide, consisting of a network of light blue lines and small circles, resembling a circuit board or a neural network, extending from the top to the bottom.

R

R

statisticians are utilizing R for its incredible statistical computing power. R is an open-source programming language, which makes it even more appealing.

Mathematical data miners are also known for using R because you can make all sorts of programs for running through data quickly and mining data without any extra work involved. Because of this, the popularity of R has increased quite a bit in recent years.

A decorative graphic on the left side of the slide, consisting of a network of light blue lines and small circles, resembling a circuit board or a neural network diagram.

A decorative graphic on the left side of the slide, consisting of a network of light blue lines and circles, resembling a circuit board or a neural network, set against a dark blue background.

What is NumPy?

NumPy is the fundamental package for scientific computing in Python. It is a Python library that provides a multidimensional array object, various derived objects (such as masked arrays and matrices), and an assortment of routines for fast operations on arrays, including mathematical, logical, shape manipulation, sorting, selecting, I/O, discrete Fourier transforms, basic linear algebra, basic statistical operations, random simulation and much more.

SciPy library

. It provides many user-friendly and efficient numerical routines, such as routines for numerical integration, interpolation, optimization, linear algebra, and statistics.

A decorative graphic on the left side of the slide, consisting of a network of light blue lines and small circles, resembling a circuit board or a neural network diagram.

```
# iterate through rows of X
for i in range(len(X)):
    # iterate through columns of Y
    for j in range(len(Y[0])):
        # iterate through rows of Y
        for k in range(len(Y)):
            result[i][j] += X[i][k] * Y[k][j]
```

C

WHY?

IT'S FAST

20	34	⬆	Fortran	0.91%	+0.58%

A decorative graphic on the left side of the slide, consisting of a network of light blue lines and circles of varying sizes, resembling a circuit board or a neural network diagram. The lines are vertical and horizontal, with some diagonal connections, and the circles are placed at various points along these lines.

C

C and C++ provide multiple uses, so you're not only going to find these in the math field. In fact, they are more general in terms of programming, but they stand strong for mathematical programs.

Overall, C has a solid reputation when you're trying to get something done quickly. The processing speed is one of its best qualities, seeing as how many students are known to write small C programs in order to process repetitious problems.

```
void multiplyMatrices(int firstMatrix[][10], int secondMatrix[][10], int mult[][10], int rowFirst, int columnSecond, int columnFirst)
{
    int i, j, k;

    // Initializing elements of matrix mult to 0.
    for(i = 0; i < rowFirst; ++i)
    {
        for(j = 0; j < columnSecond; ++j)
        {
            mult[i][j] = 0;
        }
    }

    // Multiplying matrix firstMatrix and secondMatrix and storing in array mult.
    for(i = 0; i < rowFirst; ++i)
    {
        for(j = 0; j < columnSecond; ++j)
        {
            for(k=0; k<columnFirst; ++k)
            {
                mult[i][j] += firstMatrix[i][k] * secondMatrix[k][j];
            }
        }
    }
}
```

A decorative graphic on the left side of the slide, consisting of a network of light blue lines and small circles, resembling a circuit board or a neural network, extending from the top to the bottom of the frame.
