Подлежащее + will + not + be + Глагол III + [by Object]
- The diagnosis would not be made correctly

*Future in the past of
Passive voice*

Lung abscess may develop because of various factors. In cases when an abscess develops as a complication of pneumonia the patient's general condition gradually becomes worse.

*Lung
Abscess*

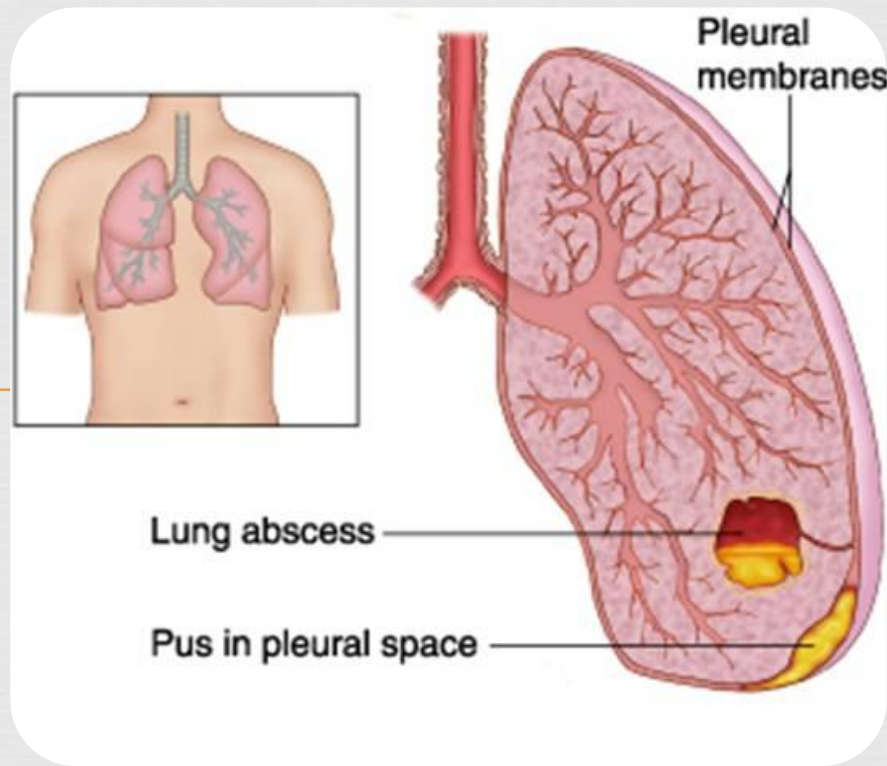

- Some manifestations of a chill, pain in the affected side, fever elevating to $39-40^{\circ}$, and loss of appetite are present.

*Lung
Abscess*

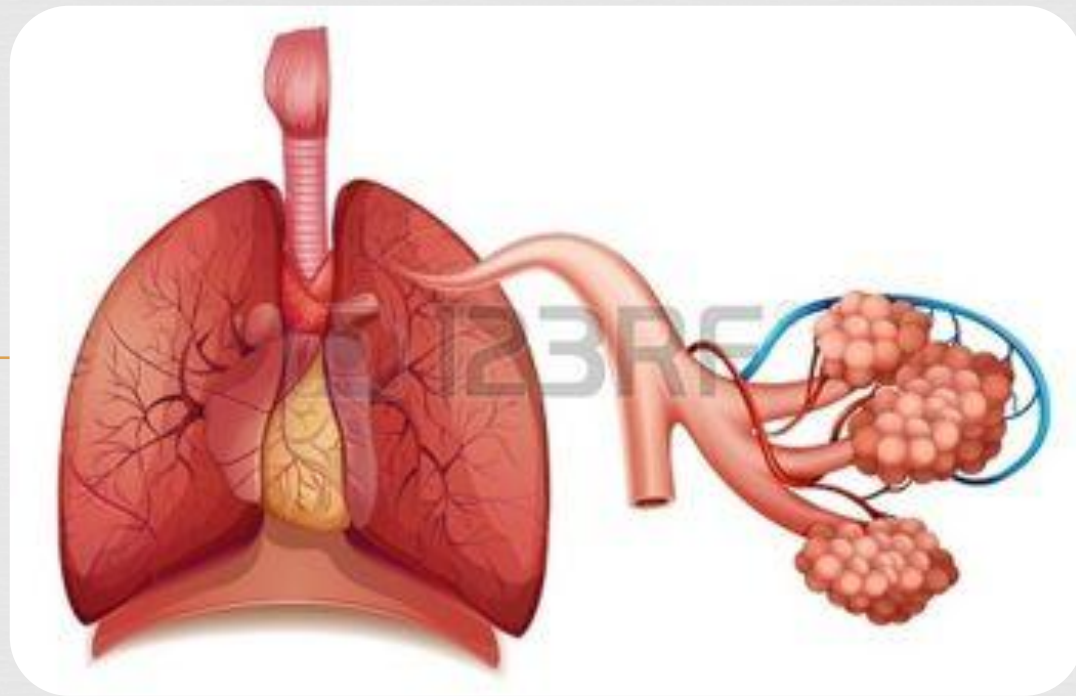

- There is a profuse perspiration at night, dry cough, and a considerable increase of the white blood cell count up to 20,000 per cu mm of blood and accelerated ESR.

*Lung
Abscess*

- The course of the lung abscess may be divided into two periods: that before and that after the rupture of the abscess into a bronchus. The length of the first period varies in different cases. The second period begins from the moment of the abscess rupture into a bronchus usually with 0,5 litre or more of sputum discharge.

*Lung
Abscess*

- After the rupture of sputum into a bronchus, the body temperature returns to normal, and the patient's general condition becomes better.
- Within 4-5 weeks of effective treatment complete recovery is usually observed in most cases of lung abscess.

*Lung
Abscess*

*Thank you for attention
and be healthy!*
