ECOLOGIC PROBLEMS

Itroduction

- Hi everyone, let me introduce myself, I'm Leo Gorsky, I am student of 10"b" class and today I am going to tell you about ecologic problems.

- First of all I need to say that ecologic problem (I will say “EP”) is the most serious problem in our world, tons of trash drop in the landfill every year, it burns, smells and make people feel sick.

- ⦿ This remains a problem to this day.
For example in Moscow region even if people make a meeting - authorities don't do anything.
But people are still forced to breathe polluted air

The biggest dump in the world is the “Pacific Dump Gyre”

The main garbage taken out here – plastic.
The area of this dump is 6 thousand kilometers².

There are many ways to recycle garbage

Pyrolysis is the most effective way recycling trash

Advantages of this method:

- production of pyrolysis oils
- the selection of pyrolysis gas
- the minimum amount of harmful substances is allocated

Conclusion

- in conclusion, I want to say that the problems of environmental pollution should be solved as quickly as possible and better
