Purpose of the lesson:

*An explanation of the new concepts for
childrens.*

Definition

A triangle is a polygon with exactly three sides

Because it is a polygon, it follows that it also has three vertices and three angles.

h-height
l- bisector
m- median

Types of Triangle

An isosceles triangle is a triangle in which two sides are the same length.

An equilateral triangle is a triangle in which all three sides are the same length:

A scalene triangle is a triangle in which all three sides are of different lengths.

A right-angled triangle is a triangle in which one of the vertices is a right angle.

EQUAL TRIANGLES

If 2 sides and the angle between them of the same triangle are accordingly equal to 2 sides and the angle between them of the other triangle, then these triangles are equal.

Given:

AB is equal to A1B1

AC is equal to A1C1

The angle A is equal to the angle A1

To be to prove that:

The triangle ABC is equal to the triangle A1B1C1

The perimeter is the distance around a closed plane figure.

The perimeter, P , of a triangle is given by the formula

$$P = a + b + c$$

where a , b and c are the side lengths of the triangle.

$$\text{Area} = \frac{bh}{2}$$

The area of a triangle is given by the formula

Find the area of

$$\begin{aligned}\text{Area} &= \frac{1}{2} (bh) \\ \text{Area} &= \frac{1}{2} (13\text{cm} \cdot 6\text{cm}) \\ \text{Area} &= \frac{1}{2} (78\text{cm}^2) \\ \text{Area} &= 39\text{cm}^2\end{aligned}$$

Heron's Formula

△ ABC: sides a, b, c

Semiperimeter: $s = \frac{a+b+c}{2}$

To Prove:

Area △ ABC: $K = \sqrt{s(s-a)(s-b)(s-c)}$

Sum of the interior angles of a triangle is 180°

The figure below shows an isosceles triangle.

$$\text{Angle Sum} = 180^\circ$$

$$m + 70^\circ + 70^\circ = 180^\circ$$

$$m + 140^\circ = 180^\circ$$

$$m = ?$$

What is the value of m ?

PYTHAGORE AN THEOREM

$$c^2 = a^2 + b^2$$

Find the length of the triangle below

$$\begin{aligned}a^2 + b^2 &= c^2 \\5^2 + b^2 &= 13^2 \\25 + b^2 &= 169 \\b^2 &= 144 \\\sqrt{b^2} &= \sqrt{144} \\b &= 12\end{aligned}$$

$$\begin{aligned}a^2 + b^2 &= c^2 \\12^2 + 9^2 &= c^2 \\144 + 81 &= c^2 \\225 &= c^2 \\\sqrt{225} &= \sqrt{c^2} \\15 &= c\end{aligned}$$
